NEW AMERICAN POTATOS.

The following varieties have been carefully tested in various  
parts of this country as well as in Europe, and have met with  
the unqualified approval of all who have given them a trial.  
For exhibition purposes they are unrivalled, and have already  
secured many prizes:—

1. **PRIDE OF AMERICA**.—In appearance resembles the  
Snowflake, a few days later; very productive, large size,  
an excellent keeper; of superior quality.
2. **MATCHLESS**.—Tubers very handsome, round, pale red;  
flesh fine grained, pure white, and of excellent quality. A  
great cropper, an excellent keeper.
3. **SILVERSKIN**.—A cross between the Early Rose and  
White Peach Blow. Tubers medium to large. Skin  
smooth, silvery white, russeted. Flesh snowy white, fine  
grain, splendid quality: an excellent keeper.

One pound of either of the above varieties will be mailed  
post-paid to any address in Europe, upon receipt of 4s., or its  
equivalent in English currency.

Remittances can be made in Post-office Stamps or Postal  
Money Order on New York or London, payable to B. K.  
BLISS AND SON.

The above varieties can also be obtained of Messrs. HOOPER  
AND CO., Covent Garden, W.C.; of CARTER, DUNNETT,  
AND BEALE, London, W.C.; of D. BRINKWORTH AND  
SONS, Reading; KERR AND FOTHERINGHAM, Dum-  
fries, Scotland.

BLISS' ILLUSTRATED POTATO CATALOGUE  
contains a descriptive list of all the new varieties recently  
introduced, with many other desirable sorts, beautifully  
illustrated. Centennial Collection of 500 varieties. Also much  
useful information upon the cultivation of this valuable esculent.  
Mailed post-paid to applicants enclosing six penny stamps.

All of the older standard varieties, sound and healthy stock,  
supplied in any quantity at market prices.

ADDRESS,

**B. K. BLISS & SONS,**  
34, Barclay Street, New York, U.S.A.

Also EARLY ROSE, SNOWFLAKE and REGENTS, by the 5 or 10 tons. Peterborough.—March 16, 1880.

TREE SEEDS.—ABIES DOUGLASHI, post-free, 2s. 6d. per ounce. MENZIESII, post-free, 4s. per ounce. PICEA NOBILIS, post-free, 4s. per ounce. PINUS MONTICOLA, post-free, 3s. per ounce. LARCH, Native, 2s. per pound.

The above are all of crop 1879, and collected from Trees grown in Scotland, and may be fully relied on for purity and hardness.

Special prices for large quantities, and to the Trade, on application. BEN. REID AND CO., Nurserymen and Seed-men, Aberdeen.

SEED POTATOS.—Snowflake Paterson's Victoria Early Rose Regent Myatt's Prolific Dalmahoy Fortyfold Fluke Bresee's Prolific Champion (Scotch) Early Shaw Redskin Flourball

And other leading varieties. Prices on application to JOSIAH H. BATH, York Street, Borough Market, S.E.

Special Offer of Hardy Conifers. MORRISON BROTHERS, Aberdeen, having a large stock of the above, will be glad to send, carriage paid to any address, 6 1-y. transplanted Plants of each of the following fine sorts for 4s. 10s., or 12 of each for 4s. 8s.:

Table listing various tree species and their prices, including Abies Douglasii, Douglasii glauca, Engelmanni, Hookeriana, Menziesii, Mertensiana, orientalis, Schrenckiana, Cedrus atlantica, Deodara, Libani, Cryptomeria elegans, Cupressus Lawsoniana, Picea bifolia, concolor violacea, magnifica, nobilis, Nordmanniana, Pinus aristata, Benthamiana, Bolanderii, Cembra, Pinus contorta, Coulterii, deflexa, flexilis, insignis, Jeffreyi, Lambertiana, monticola, muricata, parviflora, ponderosa, tuberculata, Retinospora filifera, obtusa, pisifera, plumosa aurea, squarrosa, Thuja gigantea, Lobbi, orientalis, Vervaeiana, Thujopsis dolabrata, latevirens, Standishii, Wellingtonia gigantea.

Being able to offer most of the above varieties by the 1000, will be glad to make special offers to large buyers.

Also a large stock of Seedling and Transplanted FOREST TREES. Priced CATALOGUES may be had on application. Forbesfield Nurseries, Aberdeen.

SEED POTATOS. Myatt's Kidney Scotch Blue Beauty of Hebron Snowflake Bresee's Peerless Victoria Brownell's Beauty Walker's Regent Compton's Surprise Wonderful Red Kidney Dalmahoy Pride of America Early Rose Silver-skin Early Fortyfold Matchless Grampan Mammoth Pearl Improved Peachblow Dunmore Oneida Paragon Porter's Excelsior Red-skin Flourball Ruby Scotch Champion

And many other sorts. Lowest price per hundredweight or ton, on application. KEHR AND FOTHERINGHAM, Dumfries.

AN ACRE OF VIOLAS AND VIOLETS.—Can supply good plants, full of flower, at the very cheapest rate, either by the dozen or 1000. For the most correct and complete descriptions respecting them see H. C.'s "Floral Guide," post-free for twelve stamps. The Home for Flowers, Swanley, Kent.

Strawberries—Wholesale and Retail. H. CANNELL begs to announce that he has now 200,000 prepared very strong Runners of all the best Kentish varieties in cultivation, and if planted at once will produce fruit next year. Every one warranted true to name. LISTS (also those in pots) post-free. Special prices for large quantities. H. CANNELL, The Home for Flowers, Swanley, Kent.

Vines—Vines—Vines. F. AND A. SMITH can supply the above, in strong close-jointed Canes, true to name, Fruiting and Planting. Price on application. The Nurseries, West Dulwich, S.E.

G. COENS, St. Pierre-Alost Nursery, Ghent, Belgium, begs to offer PALMS of all descriptions—Hardy, Temperate, and Stove species—in pots and tubs. Price LIST free by post.

ARECA RUBRA, last year's Seedlings, £1 per 100. CHAMEROPS EXCELSA, four to six leaves, £1 5s. per 100; one to two divided leaves, £1 10s. per 100. LATANIA BOREONICA, last year's Seedlings, 6s. per 100, £2 10s. per 1000. £22 10s. per 10,000. DRACÆNA INDIVISA, LINEATA, VEITCHII, last year's Seedlings, 6s. per 100, £2 10s. per 1000. ARALIA STEBOLDII, in single pots, last year's Seedlings, £1 per 100. SEEMANN AND GOEPEL, The Nurseries, Marienthal, Wandsbeck, near Hamburg.

SEND FOR A CATALOGUE.

The "Christian Union" says:—"MR. CANNELL'S HOME FOR FLOWERS at Swanley, Kent, is known to all florists for its varied excellencies, but it is well that it should be known to multitudes who may not be professional florists, but who have a really good and natural liking for a pretty flower or plant in their private gardens, verandahs, or window sills. Everything in the enjoyment to be obtained from this period onward through the season depends on the stock from which the seeds or plants are derived. Mr. Cannell's establishment at Swanley is devoted exclusively to Florists' flowers, and is probably the only one in the kingdom of which this can be said; and as Mr. Cannell himself is a Fellow of the Royal Horticultural Society, every one may judge what results ensue from a highly specialised direction of this kind under the most ample science and experience. In looking over the Descriptive Catalogue of Seeds one perceives the immense variety of genera and species therein embraced; but the testimonials appended are still more convincing and carry a more palpable weight of evidence to the general mind. The testimonials come not only from every quarter of the United Kingdom, but from India, Australia, and other parts of the world to which English culture in other forms has so widely and permanently spread. His Seeds are of the highest excellence. It is one of the greatest of all the wonders in the floral culture of this country."

SEED CATALOGUE POST-FREE.

THE above is now admitted throughout the world to be the most replete Illustrated and Descriptive CATALOGUE of Florists' Flowers and the Seeds ever issued. No garden of the least pretence should be without this work even the professional refers to it for guidance, as it describes all the best varieties (new and old) in cultivation, supplied either as cuttings, root cuttings, or plants, at the lowest price consistent with correctness.

CALCEOLARIAS (Spotted).—H. C.'s best Strain in 6's, 2s. 6d., by post; 2s. per dozen. Special price per 100 and 1000.

H. CANNELL, F.R.H.S. THE HOME FOR FLOWERS, SWANLEY, KENT.

SMITH'S BALSAM.—Seed of this can be had from most Seedsmen throughout the world, in 1s. and 2s. packets mixed, and in 2s. 6d. collections of nine colours; also CINERARIA, PRIMULA, and CALCEOLARIA, in 1s., 2s., 6d., and 5s. packets, or direct from F. AND A. SMITH, The Nurseries, West Dulwich, S.E. N.B.—Blossoms from our superb collection of Cinerarias and Primulas sent per post on receipt of four stamps.

FISHER, SON & SIBRAY, Late FISHER, HOLMES & Co., NURSERYMEN, SEEDSMEN and FLORISTS, HANDSWORTH, SHEFFIELD. Nurseries:—Handsworth. Seed Warehouses:—Corner of Market Street, Sheffield, and Church Street, Rotherham.

FOR SALE, 2,000,000 TRANSPLANTED FOREST TREES, ALL FINE CLEAN GROWN PLANTS.

Table listing various tree species and their prices, including Alder, Ash, Broom, Buckthorn, Chestnut, Elm, Holly, Hornbeam, Limes, Maple, Oak, Poplars, Privet, Quick, Sycamore, Thorn, Whin or Gorse, Willow.

SEEDLINGS. ASH 1-yr. £6 0 0 per 100,000. AUSTRIAN PINE 2-yr. 12 10 0 per 1000. CORNICAN PINE 2-yr. 15 0 0 per 100,000. LARCH, very fine 1-yr. 0 9 0 per 1000. SPRUCE 2-yr. 6 0 0 per 100,000.

PETER S. ROBERTSON & CO., TRINITY NURSERIES, EDINBURGH.

DANIELS' SUPERB PANSIES.

EVERY ONE HAVING A GARDEN should procure Seeds of the following superb varieties, which we have much pleasure in offering:—

Table listing various Pansy varieties and their prices, including Pansy Show and Fancy, Large Blotched, Improved Striped, Emperor William, King of the Blacks, Pure White, Light Blue, Pure Yellow, Rich Purple.

From W. MARSHALL, Esq., F.R.S., Dublin. "My Pansies, from your seed, are and have been the admiration of all my friends and neighbours."

# LATE SPRING FROSTS DEFIED.

WEEKS'S  
IMPROVED.

## SUMMARIZED ADVANTAGES.

- 1.—Being on Cast Iron and Slate Foundations they are removable and imperishable.
- 2.—Economy of space, Brickwork being dispensed with.
- 3.—The Slate Panels being movable, facilitates the renewal of border.
- 4.—The increase of tree surface is about 75 per cent., and it is, therefore, only reasonable to conclude a correspondingly increased crop will be the result.
- 5.—The Trees being planted transversely of the House affords the entire surface of back wall to be planted.
- 6.—The border space between the trellises can be planted with winter salads.

Peach Houses of this description combine Utility with Ornament in a very marked manner.

For Heavy Cropping these Houses are unsurpassed.

THE QUEEN'S SEEDSMEN,  
READING.

THE  
**Gardeners' Chronicle.**

SATURDAY, MARCH 20, 1880.

FORCING BY ELECTRIC LIGHT.

MY object in making these experiments was to ascertain whether electric light exercised any decided effect upon the growth of plants. For this purpose I placed the regulator in a lamp with a metallic reflector in the open air, about 2 metres above the glass of a sunk Melon-house. A considerable number of pots were provided, sown and planted with quick-growing seeds and plants, such as Mustard, Carrots, Swedes, Beans, Cucumbers, and Melons. The plants could then be brought at suitable intervals under the influence of daylight and electric light, without moving them, both falling upon them approximately at the same angle. The pots were divided into four groups.

1. One pot of each group was kept entirely in the dark.
2. One was exposed to the influence of the electric light only.
3. One was exposed to the influence of daylight only.
4. One was exposed successively to both day and electric light.

The electric light was supplied for six hours, from five to eleven each evening, all the plants being left in darkness during the remainder of the night.

In all cases the differences of effect were unmistakable. The plants kept in the dark were pale yellow, thin in the stalk, and soon died. Those exposed to electric light only showed a light-green leaf, and had sufficient vigour to survive. Those exposed to daylight only were of a darker green and greater vigour. Those exposed to both sources of light showed a decided superiority in vigour over all the others, and the green of the leaf was of a dark rich hue.

It must be remembered that, in this contest of electric against solar light, the time of exposure was in favour of the latter in the proportion of nearly two to one, but all allowance made, daylight appeared to be about twice as effective as electric light. It was evident, however, that the electric light was not well placed for giving out its power advantageously. The nights being cold, and the plants under experiment for the most part of a character to require a hot moist atmosphere, the glass was covered very thickly with moisture, which greatly obstructed the action of the light, besides which, the electric light had to pass through the glass of its own lamp.\* Notwithstanding these drawbacks, electric light was clearly sufficiently powerful to form chlorophyll and its derivatives in the plants. It was interesting to observe that the Mustard-seed stem, when placed obliquely, turned completely towards the light in the course of two or three hours, and that Cucumber

\* Professor Stokes has shown, in 1853, that the electric arc is particularly rich in highly refrangible invisible rays, a circumstance which seems to point to a great loss on passing those rays through glass.

and Melon plants were affected in the same way, though at a slower rate. The Cucumber and Melon plants which have been exposed to both day and electric light have made great progress, and my gardener, Mr. D. Buchanan, says that he could not have brought on the latter, without the aid of electric light, during the early winter. Some of these commenced to blossom on February 14.

These preliminary trials go to prove that electric light can be utilised in aid of solar light by placing it over greenhouses, but the loss of effect in such cases must be considerable. I, therefore, directed my observations, in the next place, to the effect of electric light upon plants, when both were placed in the same apartment. A section of the Melon-house, already referred to (7' 3" X 3' 8", 2.21 m. X 0.19 m.), was completely darkened by being covered in with thick matting, and was whitewashed inside. The electric light was placed over the entrance door, and shelves were put down, in a horseshoe form, to receive the pots containing the plants to be exposed to the action of electric light, the plants being placed at distances from the lamp varying from 0.5 metre to 2 metres. Upon the first occasion of trying the naked electric light in this manner, some of the plants, and especially some Melon and Cucumber plants, from 20 centims. to 40 centims. in height, which were within a metre distance from the lamp, commenced to suffer; those leaves which were directly opposite the light turning up at the edges and presenting a scorched appearance. On subsequent nights, therefore, the stands were so arranged that the distance of the plants from the light varied from 1.5 metre to 2.3 metres.

The plants under experiment were divided into three groups; one group was exposed to daylight alone, a second similar group was exposed to electric light during eleven hours of the night, and were kept in the dark chamber during the daytime, and the third similar group was exposed to eleven hours' day and eleven hours' electric light. These experiments were continued during four days and nights consecutively, and the results observed are of a very striking and decisive character, as regards the behaviour of such quick-growing plants as Mustard, Carrots, &c. The experiment was unsatisfactory in this one respect, that during the third night the gas-engine working the dynamo-machine came to a standstill, owing to a stoppage in one of the gas channels, and thus more than half the electric-light influence that night was lost to the plants. But, notwithstanding this drawback, the two groups of plants showed unmistakably the beneficial influence of electric light. The plants that had been exposed to daylight alone (comprising a fair proportion of sunlight) presented their usually healthy green appearance; those exposed to electric light alone were, in most instances, of a somewhat lighter, but, in one instance, of a somewhat darker hue than those exposed to daylight; and all the plants that had the double benefit of day and electric light far surpassed the others in darkness of green and vigorous appearance generally. A fear had been expressed that the Melon and Cucumber plants, which had been scorched by excess of electric light on the first evening, would droop or die if further exposed to that agency, but I insisted upon their being placed within the influence of the electric light, at a distance from it exceeding 2 metres, and all of them have shown signs of recovery, throwing out fresh leaves and pearls of moisture at their edges.

#### THE ELECTRIC LIGHT SUPPLIES HEAT.

One object I had in view in this experiment was to observe whether the carbonic and nitrogenous compounds produced within the electric arc exercised any deleterious action upon

the plants. All continuous access of air into the stove was closed, and in order to prevent excessive accumulation of heat the stove-pipes were thickly covered with matting and wet leaves. But although the access of stove heat was thus virtually stopped, the temperature of the house was maintained throughout the night at 72° Fahr., proving that the electric lamp furnished not only a supply of effective light, but of stove heat also. No hurtful effect was moreover observed on the plants from the want of ventilation, and it would appear probable that the supply of pure carbonic acid resulting from the complete combustion of the carbon electrodes at high temperature, and under the influence of an excess of oxygen, sufficed to sustain their vital functions. If the nitrogenous compounds which Professor Dewar has shown to be developed in the electric arc were produced in large quantities, injurious effects upon the plants must undoubtedly ensue, but it can be shown that in a well-conditioned electric lamp, with a free circulation of air round the carbon electrodes, the amount of these products is exceedingly small, and of a different nature than is produced in a confined space. They could not indeed be perceived by their smell in the stove, when all ventilators were closed, and no injurious effects from them have hitherto been observed in the plants.

#### REST OF PLANTS.

These experiments are not only instructive in proving the sufficiency of electric light alone to promote vegetation, but they also go to prove the important fact that diurnal repose is not necessary for the life of plants, although the

FIG. 63.—PLAN OF ARRANGEMENT OF ELECTRIC LIGHT IN FRUIT GARDEN.

duration of the experiments is too limited perhaps to furnish that proof in an absolute manner. It may, however, be argued from analogy that such repose is not necessary, seeing that [annual] crops grow and ripen in a wonderfully short space of time in the northern regions of Sweden and Norway, and Finland, where the summer does not exceed two months, during which period the sun scarcely sets.

The next step in the course of these experiments was to remove the electric lamp into a Palm-house, constructed of framed glass, which was 28 feet 3 inches long, 14 feet 6 inches wide, and averaging 14 feet 6 inches (8.62 m. X 4.42 m. X 4.42 m.) in height. In the centre of this house a Banana and a few small Palms are planted, the sides of the house all round being occupied with a variety of flowering plants. The electric light was fixed as high as practicable at the south corner of the house, in order that its rays might fall upon the plants from a direction and at an angle coincident with those of the sun during the middle of the day. A metal reflector was placed behind the lamp in order to utilise the electric rays as much as possible. Along the eastern side of the house are some young Vines, having their roots in a bed outside. Three pots of Nectarines, just beginning to bud, were placed on the floor at various distances from the electric light, and also some pot Roses, Pelargoniums, Orchids, &c. The temperature of the house was maintained at 65° Fahr., and the electric lamp was kept alight from 5 P.M. to 6 A.M., for one week, from February 18 to February 24, excepting Sunday night. The time was hardly sufficient to produce very striking effects, but all the plants continued to present a healthy appearance. Of three Alicante Vines, the one nearest

the electric light made most progress, and the same may be said of the Nectarines and Roses. It was observed that other plants, such as Pelargoniums, continued to exhibit a vigorous appearance, notwithstanding the heat of the place. The electric light appeared to impart the vitality necessary to prevent a collapse of the organism through excessive temperature. This experiment is of importance in showing that the electric light if put into conservatories or greenhouses does not injure the plants, but rather improves their appearance and growth. The leaves assume a darker and more vigorous appearance, and it seems that the colouring of the flowers becomes more vivid, but a further period of time is necessary to establish this observation absolutely. The effects producible by electric light in conservatories are very striking, owing to the clear definition of form and colour produced, far exceeding that of ordinary daylight.

#### THE ELECTRIC LIGHT OUT-OF-DOORS.

No further results of any particular interest could be expected from a continuance of this experiment, and I decided to try the effect of electric light as a means of promoting growth in the open air and under glass at the same time. The regulator was put back into its first position, 2 metres above the ground, with a sunken Melon-house on one side, and a sunken house containing Roses, Lilies, Strawberries, and a variety of other plants on the other. The space of ground between these, about 1 metre broad and 7 metres long, was covered with boxes sown with early vegetables, including Mustard, Peas, Beans, and Potatoes, and in order to prevent cold winds from injuring the plants low protecting walls were put up across the openings of the passage between the two houses. The effect of electric light could thus be observed at the same time, upon the Melon and Cucumber plants in the one house, upon the Roses, Strawberries, &c., at a lower temperature in the other, and upon the early vegetables unprovided with covering.

Some weeks must elapse before any absolute results can be given, but growth is evidently promoted under all these various circumstances. In order to test this clearly, a portion of the plants both under glass and in the open air were shaded from the electric light without removing them from their position of equal temperature and exposed to solar light during daytime. The effect upon the flowering plants is very striking, electric light being apparently more efficacious to bring them on than sunlight. Although the amount of heat given off from the electric arc is not great compared with a gas flame (giving off its products of combustion), yet the rays of intense heat of the arc counteract that loss of heat by radiation from the leaves into space which during a clear night causes hoar frost. For this reason I expect that electric light may be usefully employed in front of fruit walls, in orchards, and in kitchen gardens, to save the fruit-bud at the time of setting; and in this application electric light will probably be found a useful agent not only to promote rapid growth, but to insure a better yield of fruit. Experience alone can determine absolutely the effect of electric light upon the ripening of delicate fruit, but considering its evident power to form chlorophyll, there seems no reason to suppose that its action would not also in this case resemble that of the sun, and that saccharine matter, and more especially the aromatic constituents, would be produced. In this country solar light is too often found insufficient to ripen the fruit or even the wood of fruit trees during the short summer months; and I believe that electric light will be found a most useful auxiliary to solar light to effect the production of ripe and aromatic fruit both under glass and in the open air.

ESTIMATED COST OF ELECTRO-HORTICULTURE.

A very important question is that of the cost of electro-horticulture. This will depend in a great measure upon the cost of the fuel or other source of energy, and upon the scale of application. To work only one electric lamp by means of a small steam or gas engine is expensive both in fuel and in cost of attendance. If steam-power has to be resorted to, an engine of sufficient size should be employed to give economical results per horse-power of energy produced, and the electric arc should be of sufficient brilliancy to give a good effect for the power expended. Experience in electric illumination has established a form and size of machine, both convenient and suitable for the attainment of economical results, viz., the medium dynamo-electric machine, which, if applied to a suitable regulator, produces fully 6000 candle-power of diffused light with an expenditure of 4 horse-power.

The experiments before given show that the most effective height at which to place the naked electric light of 1400 candle-power is about 2 metres (6 feet 5 inches). By providing a metallic reflector, and thus throwing the major portion of the upward rays down upon the surface to be illuminated, that height may be taken at 3 metres. If the electric arc employed were equal to 6000 candles, the height would be  $\frac{\sqrt{6000}}{\sqrt{1400}} \times 3 = 6.2$  metres, at which such an electric light should be fixed under the protection of a tin plate or other reflector. In operating upon an extended surface several lamps should be placed at such distances apart as to make the effect over it tolerably uniform. The effect of radiation would be equally distributed over the ground if the radiating centres were placed at distances apart equal to double their height above the ground; for under these circumstances a square foot of surface midway between them would receive from each centre one-half the number of rays falling upon such a surface immediately below a centre. A plant at the intermediate point would, however, have the advantage of presenting a larger leaf-surface to the two sources of light; and in order to compensate for this advantage the light centres may be placed considerably further apart, say at distances equal to three times their elevation, or 18 metres. Nine lights so placed would cover an area 54 metres square, or just about three-quarters of an acre. If this space were enclosed with a high fruit wall (as shown with the lamp centres marked in the accompanying sketch, fig. 63), this will also get the full benefit of electric radiation, and would serve at the same time to protect the plants from winds. Protection against injury from this latter cause might be further carried out with advantage by following the plan adopted (with excellent results I believe) by Sir William Armstrong—that of subdividing the area under forced cultivation by vertical partitions of glass.

The engine-power necessary to maintain this radiant action would be  $9 \times 4 = 36$  horse-power, involving the consumption of  $36 \times 2\frac{1}{2} = 90$  lb. of fuel per hour, or say, for a night of twelve hours (with an allowance of 40 lb. for getting up steam) 10 cwt., which, at 16s. per ton, would cost 8s. This expenditure would not include, however, the cost of carbons and of an attendant, which would probably amount to another 8s., making a total of 16s. If, however, an engine can be found doing other descriptions of work during the daytime, the cost of steam-power and attendance for the night-work only would be considerably reduced. In the calculation just given I have assumed the employment of fuel for the production of mechanical energy, whereas the question will assume a totally different aspect if natural sources of power, such as waterfalls, can be made available within the reasonable distance of half a mile. The expenditure for

energy will, in that case, be almost entirely saved, and that of attendance be greatly diminished, and under such circumstances it seems probable that electro-horticulture may be carried out with considerable advantage.

The experiments furnish proof that the management of the electrical apparatus presents no particular difficulty, as the gas-engine, dynamo-machine, and regulator have been under the sole management of my head gardener, Mr. D. Buchanan, and his son, an assistant gardener. The regulator requires no attention beyond the replacement of carbons every four or five hours, which period may easily be increased to twelve hours by a slight modification of the lamp. *C. William Siemens.* [The substance of a paper presented to the Royal Society.]

Since the above communication was put into type we have received the following letter from Dr. Siemens, which is so important that we lose no time in laying it before our readers:—"The Strawberries exposed to the electric light have made extraordinary progress, and I shall exhibit before the Royal Society to-morrow night (March 18) two pots that were exactly alike a fortnight ago, the one which was exposed to the electric light having now ripe fruit, while the other, which was exposed to solar light only, but kept at the same temperature, has, as yet, only unripe green fruit. At the Royal Society to-morrow you will have an opportunity of tasting the fruit, to ascertain whether the electric light produces aroma or not. It is also interesting to observe some Melon plants, which did remarkably well under the night influence of the electric light, but which have produced much fewer leaves since the light has been shifted to another point for the Strawberries. Regarding the question of cost, I find that the power costs me 67 cubic feet of gas per hour, say 4s. per hour, or, including attendance, 6s. per hour for a light of 1400 candle-power. Greater powers than this would be relatively cheaper. *C. W. Siemens.*"

JAPANESE CONIFERS.—XI.

(Continued from p. 300.)

*PICEA MAXIMOWICZII*.—This plant at present is a mystery: very little is known about it. Moreover, if it do not prove better-looking in the future than

FIG. 64.—*PICEA MAXIMOWICZII*: TRANSVERSE SECTION OF LEAF, MAGN.

the young plants do now, it is not likely to find much favour with planters. All that we know of its history is comprised in the foot-note. The plant, as seen in English gardens, is starved and miserable-looking, as if it were anything but at home in our climate. It is apparently a dwarf Spruce, with the young shoots cinnamon-brown, glabrous, the needle-shaped dark green, four-sided, spine-tipped leaves spread on all sides almost at right angles to the stem. When cut across they present hypoderm uniformly distributed in a single layer, without palisade cells, but, with what is very curious, a single resin canal beneath the midrib, exactly as in *Tsuga*, to which otherwise the plant seems to have no resemblance. Sometimes the leaves are destitute of resin canals. M. Carrière describes the seeds and the embryo plant, but gives no opinion as to the affinity of the species. Maximowicz, as cited by Franchet and Savatier, refers the plant as a variety to *P. obovata*, and states that the seeds were sent probably from Nippon by Tschonoski in 1805. In any case the solitary resin canal is quite exceptional. *M. T. M.*

New Garden Plants.

*CYPRIPEDIUM SPECTRIANUM*, n. sp., in litt. ad cl. Veitch, Dec. 1878.\* [Gard. Chron. 1880, vol. xiii., p. 41.]

This is a most lovely original species, named by me on December 1, 1878. It stands just beside the curious *Cypridium Fairrianum*, having the same narrow petals, curved down sideways; they are light green, with a purple middle line and copious most minute freckles on the upper side over the middle line, the border much waved. The standard-like upper sepal is the chief ornament. It is transverse oblong, blunt acute, with reflexed margins, thus making one think of an old-fashioned shepherd's hat, pure white at the base, as light green as a young adult green frog (*Hyla arborea*), the middle line being of a beautiful purple. The connate oblong acute lateral sepals are of a light whitish-green. The lip is shaped like that of *Cypridium Fairrianum*, but it is much larger, olive-green, with a brown anterior part, side lobes with red margin. The nearly square staminode has three very blunt rather evanescent lobes in front; colour mauve with a white anterior border and a queer yellow figure in the centre, which may be compared with two three-branched deer-horns with that part of the skull whereon they are inserted, just as they may often be seen in the rooms or lobbies of enthusiastic hunters.

This lovely plant has recently been figured in these columns. It was sent me in 1878, and exhibited at the end of 1879 by Messrs. Veitch. *H. G. Rehb. f.*

BRITISH AMERICAN VIOLAS.†

In this paper the author states that his object is to interest botanists in the study of a lowly but beautiful family of plants whose headquarters are in the temperate regions of America, but whose relations to each other as species, varieties, or hybrids, are as yet imperfectly known.

He has some of the related species in cultivation for the purpose of studying the remarkable variations in form, texture, and size of organs, of the same individual plants at different periods of the year, and he hopes that other botanists and cultivators may be induced to undertake a careful study of the living plants in the same way, which seems to hold out the only hope of arriving at satisfactory conclusions.

The number of British American species, not counting varieties, is twenty. Of these, eight grow within the limits of the Nova Scotia peninsula, and four others are not unlikely, sooner or later, to be added.

The species are divided into four groups:—(1) those with long and thick fleshy rhizomes, sending up annually radical leaves and flowers from terminal buds; (2) those with rhizomes sending up annually long-stalked radical leaves and leafy flower-shoots; (3) those with slender and woolly roots and stems branching into annual leafy flower-shoots; (4) those that have permanent and leafy stems and leafy stipules.

The distinctive characters of each species and of its varieties are pointed out, and also the geographical and local distribution of the various forms, which in many cases has been incorrectly indicated in published works.

The first and most beautiful of all the American Violets is *V. pedata*, a Saskatchewan and extreme Western species. *V. palmata*, Linn., which proves to be a constant and distinct species, has, thus far, been found only in one place in British America, viz., on the banks of the Sackville River, at Luceyfield, although it is not rare in the Southern and Western States. Of *V. cucullata*, the common blue Violet, there are several forms. It abounds in the Maritime Provinces generally, and in Ontario, and extends far West, both in Canada and the United States. *V. sagittata* (including *ovata*) is a rarer species, but still not uncommon from the Atlantic seaboard to the Western parts of Ontario, wherever there are sandy soils dry, and sunny banks. Its flowers are paler, and have more of a purplish tinge than those of the common blue Violet, and they come later. *V.*

\* *Cypridium Spectrianum*, n. sp., Rehb. f., MSS., 1878 — (*Acaulia coriaria viridifolia*); foliis quam in *Cypridio insigni angustioribus*; pedunculo parvis-sime piloso; bractea ancipiti, ovato trigono calvo breviori; sepalo impari cuneato-ovato apiculato transverso vexillario magno; sepalis paribus ovato acutis connatis labello brevioribus; tepalidis triangulo-figulatis acutis dorsum extrorsumque curvatis, latere sepalis imparis energetice curvatis; labelli sacco utrinque angulato, medio antice retuso; staminodio subquadrato, antice medio angulato, utrinque emarginato, ante basin utrinque margine, margine profunda et anguste sinuato. *H. G. Rehb. f.*

† A paper "On the British-American Species of the Genus *Viola*." By Professor George Lawson, Dalhousie College, Halifax. Communicated by Mr. Sadler to the Botanical Society of Edinburgh on March 11.

rotundifolia is more circumscribed in its distribution. *Viola blanda* is the common white Violet, so abundant everywhere about Halifax and throughout the other Maritime Provinces and Ontario, growing in wet places, and on Aller banks. It is the first Violet to bloom in spring, appearing in average seasons in April with the May-flower. Its flowers are delicately sweet-scented. We read in Aiton's *Hortus Kewensis*, the standard work of its time on garden plants, that this species was introduced to England by his Royal Highness the Duke of Kent, who no doubt obtained it at "The Prince's Lodge," near Halifax, where it still abounds. *V. primulefolia* was found for the first time last summer in a swamp at the Three Mile Church, near Halifax. It is closely related to the *V. Patrim*, described in the East Indian Floras as inhabiting the Nilgherries. It does not appear to have been previously found in British America. It seeds sparingly, and there seems reason to believe that it may be a hybrid between *V. lanceolata* and *V. blanda*; this point still remains to be determined. *V. lanceolata* is the white-flowered, narrow-leaved Violet, so common about Steele's Pond and Lily Lake, usually found only in swamps and by the margins of lakes.

Although this species occurs in Illinois and Kentucky, and is nowhere else so abundant as in Nova Scotia, yet it appears to be absent from the greater portion of the Province of Quebec and the whole of Ontario. *V. striata*, on the other hand, is essentially an Ontario species. The most puzzling of all the British American species is the blue leafy-stemmed Violet, which has been mostly known to botanists as *V. Muhlenbergii*, having been named in honour of the American (Dutch) botanist of that name. More recently it has been identified with the *Viola canina* of Europe. *V. canina* is an aggregate species, embracing several very distinct segregates in Europe. The only one of these which the plant resembles is *V. sylvatica*, of Fries—the common Dog Violet of Western Europe.

Although there is no plant in America corresponding to the European forms *canina* (proper), *lactea*, or *stagnina*, yet in the Far West, on both sides of the Rocky Mountains, there is a remarkable cespitose form, viz., *albiflora*, of Hooker's *Flora Boreali-Americana*, which does not seem to occur in Europe. The nearest European approach to it is apparently the mountain and arctic sub-species, *arenaria*, DC. *V. rostrata* belongs to the same group as *V. canina*, but is very distinct in appearance, and a larger and more handsome plant, yet almost the only technical character is the greater length of the spur of the flower, and there is a form intermediate in this respect.

There is an Ontario species, occurring in the woods around Kingston, Belleville, Toronto, &c. *V. canadensis* is more abundant throughout Ontario; it is the tallest of all the Violets, growing from 9 inches to 2 feet in height.

The last is the leafy stipuled species, *V. tricolor*, the original of the parti-coloured varieties of the garden Pansy. Its perennial form occurs in some places, but it is not originally a native plant in America.

## DEFENCE IN PLANTS.

PERHAPS I may be allowed to call attention to a peculiar although perhaps not singular fact, which has lately come under my notice. *Enodendron anfractuosum*, or the Silk Cotton-tree, when in a young state, is always armed with stout prickles. As the stem enlarges these are gradually shed, the bark becoming hard, and losing its green appearance. It is one of the peculiar features of the tree that the base of the stem rises in buttresses of varying thickness at the point where root and stem join, and which form a support to bear the enormous weight of the very large trunk and branches. These buttresses are not very prominent until the branches spread widely in a longitudinal direction from the trunk, when they commence to increase in size, mostly on their upper surface or ridge, and rise in a vertical direction.

On the growth taking place, there appears on their rounded surface the chlorophyll, or leaf-green, common to the epidermis at a younger stage. It is not formed on all the buttresses, or ridges, at the same time, but appears only on those situated on the side of the tree which is most in need of support, and which are therefore increasing in size most rapidly. Wherever this green appearance fully covers the part of the growth it is protected by stout prickles, developed gradually from the epidermis, undoubtedly for its protection. Cattle would not injure old bark, for there is nothing tempting about it; but where it assumes a nice green appearance, every one knows what pains they sometimes take to strip it: hence the need of protection. *J. Hart, King's House, Kingston, Jamaica.*

## PROLIFEROUS PLANTAINS.

THE common wayside Plantain (*Plantago major*) is not in general considered very ornamental, nor does it find much favour save with bird fanciers. Nevertheless there are certain forms of it which have held their place in old-fashioned gardens from time immemorial. We hope they will long continue to do so, for though the charm of colour may be wanting to them, elegance of form is not lacking. Moreover, there is an element of curiosity about them (if "in-

FIG. 65.—PROLIFEROUS PLANTAIN.

terest" be thought too fine a word) which gives them in the eyes of the plant lover an attractiveness which no mere bedding plant possesses. The variety we figure is a very fine specimen of the "Besome Plantain" or "Plantain with spiky tufts" of Kay, of Gerard, of Parkinson, and other old writers, and whose history is given in Loudon's *Martine of Natural History*, vols. iii. and ix., and in brief in Dr. Masters' *Vegetable Teratology*. For the specimen which forms the subject of our illustration (fig. 65) we are indebted to Mr. Cooling, of Derby, who forwarded it to us with the following note:—

"I have received from the Rev. Gerard Smith, of Ockbrook, near Derby, a very curious and ornamental sport

of the common Plantain, which I send for your inspection. The plant was observed growing on the edge of a field two years ago, and was transplanted to the reverend gentleman's garden. Last year the peculiar development was not so marked, but this season it has developed to the extent you see. The plant is quite strong and healthy, and in its present form quite an ornament to the shrubby border in which it is growing. It has shown no inclination to produce seed at present."

Another form is that which we figure in P. Coronopus, where the secondary branches of the spike all start from about the same spot, and so produce an umbellate appearance. We reproduce (fig. 66) an illustration of this from an earlier volume.

Equally common is the "rose Plantain," a form of *Plantago media*, in which the bracts form a leafy rosette at the top of the flower-stalk, which in place of lengthening as usual into a spike remains short and contracted.

*P. lanceolata*, the common Rib-grass, has also its special vagaries, for it is a very singular circumstance, of which we can give no explanation, that each species of Plantain has its own particular mode of transgressing the rule, and only rarely indulges in the same erratic direction as its brother Plantains do, although there is no structural reason to the contrary.

## GREENHOUSE POVERTY.

THERE was a time, not very many years back, when those who owned plants, as well as the gardeners in whose charge they were, apart from the beauty or decorative value of the plants themselves, took a pride in being in possession of such species and varieties as were not easily grown. The gardeners especially took credit to themselves when they could point to a collection composed of the more difficult-to-manage hard-wooded subjects in the vigorous healthy state that gave evidence of the grower being able to manage plants that require something more than the limited care and experience sufficient to produce in fair condition the very limited number of quick-growing, easily-managed things which now almost exclusively go to make up the whole contents of a greenhouse. Not that I have a word to say individually against the merits and usefulness from a decorative point of view of the Zonal Pelargoniums, tuberous-rooted Begonias, Fuchsias, Cinerarias, Primulas, Calceolarias, and winter-blooming bulbs that very often compose the collection, with the addition of a few Camellias and Azaleas. But this I do say, that when these and a few other things of a like character comprise, as they frequently do, the whole assemblage, then very much of the interest, pleasure, and charm that may be derived from a greenhouse is absent.

The following are some of the hard-wooded plants that are now conspicuous by their absence from nine-tenths of the gardens one sees. Commencing with the first months of the year, there are the many beautiful kinds of Epacris, ranging from pure white, all through the shades of blush and pink, to red and crimson—easily grown, profuse flowerers, requiring few or no sticks or ties, which will bear cutting so freely that the plants may each year be reduced to almost the size they were before the season's growth commenced. Boronias, with their elegant drooping shoots clothed with delicate coloured shell-like blooms, several of the species highly fragrant—in addition to which some, like *B. Drummondii* and *B. pinnata*, continue in flower for three or four months, beginning in the dead of winter. All the different species need very little tying. Chorozeas, bright coloured, free blossomed plants, the long flexible shoots of which are yearly clothed for many weeks during the spring with their orange and red flowers in such profusion as to almost hide their Holly-like foliage. Adenandras, that bloom as densely as the low bushy tufts of the hardy *Daphne Cneorum*—one of the kinds, *A. fragrans*, almost as sweet as the *Daphne*. *Acrophyllum venosum*, one of the most distinct plants ever introduced, alike handsome in its leaves and growth as in the dense panicles of its creamy-coloured Meadow-sweet-like inflorescence. *Correas*, easy to manage, and seldom failing to give a plentiful crop of their red tubular flowers, opening in succession for a long time. *Mitraria coccinea*, as easily managed as the last-named, its red mitre-shaped blooms differing from anything else sufficiently to make it deserving of a place in any collection. *Dracophyllum gracile*, elegant in its thread-like shoots, every one of which bears on its point

a snow-white tuft of papery-textured flowers, delicately scented and lasting for a couple of months: they are alike pretty on the plant and useful for cutting. *Daphne indica*, fresh green-leaved plants, unsurpassed for the fragrance of their flowers, that last well, and are an acceptable addition to any arrangement of cut flowers. *Hoveas*, free-blooming subjects, with Peach-shaped flowers of a lilac-blue colour, very suitable plants with which to clothe a pillar or occupy the corner of a house. *Aphelaxes*, free-blooming everlasting which stand unequalled for the bright starry-shaped flowers with which the plants are annually clothed in fresh condition for five or six weeks.

In addition to these may be named the elegant-habited *Tetratheas*; *Pteroma elegans*; the white-flowered *Eriostemons*, profuse bloomers that if need be will bear forcing; the beautiful bright-blossomed *Coronilla glauca*, with numbers of others, including the numerous group of Cape Heaths, which in themselves afford such variety in habit of growth, colour and form of flower, from the robust yellow-blossomed *E. Cavendishiana*, the globular, white, sweet-smelling *E. suaveolens*, to the slender branched *E. cerinthoides*, bearing from the points of its shoots tufts of the intensest

by stopping the shoots so as to induce the bushy habit they would assume of their own accord if growing naturally in the open air, and by an annual cutting back after they have flowered, not many sticks and ties would be wanted—simply just enough to support a few of the principal branches. This must be so patent to any one at all acquainted with the nature of the plants in question and the requirements for ordinary greenhouse decoration, that it looks like going over well known ground to point it out.

Even if a portion of the hard-wooded plants I have named found a place in the glass erections devoted to the growth of things that want a cool temperature, greenhouses and conservatories generally would have a very different appearance and be vastly more interesting than they at present are. The cultivation of Ferns and other fine-leaved plants, now for some years on the increase, is desirable, and exhibits a growing appreciation of beauty in form, but the presence of these by no means necessitates the absence of the most distinct and beautiful of flowering plants—rather the reverse, as a contrast and relief from the over-sombre effect too often apparent where there is a preponderance of

FIG. 66.—PROLIFEROUS PLANTAIN. (SEE P. 364.)

red flowers. So rich in different forms and colours are the Heaths, that one scarcely knows where to begin in pointing to the varieties most suitable for general decorative use. There are the *ventricosas*, that in themselves give a succession of flowers for three months in spring and summer, varying from flesh colour to the deepest pink; then there are the numerous autumn bloomers, such as *E. retorta major*, *E. Austiniana*, *E. Marnockiana*, *E. Irbiana*, and others.

Respecting the use of Heaths, and the hard-wooded plants named above, as well as many others of a like description, for ordinary greenhouse decoration, it is sometimes urged that they require an amount of training and tying which gives them too much formality in appearance, as also entailing a considerable amount of labour, and in confirmation of this the formally trained examples seen on the exhibition stage are pointed to. Yet nothing can be more groundless than such an objection, for the obvious reason that the sticks and ties requisite to secure plants in position that have to be moved backward and forward to exhibitions, conveyed as they often are hundreds of miles, are altogether unnecessary when the plants are only wanted for home use; indeed, if duly attended to in the first stages of their growth,

green foliage. One thing is certain, that if the gardeners in this country had never shown the ability to cultivate a class of plants more difficult to grow, and more generally interesting, than those now almost exclusively to be met with, they would never have had the reputation amongst Continental horticulturists of surpassing all the world in the cultivation of tender plants. *T. Buines.*

### OUTDOOR FIGS.

ON looking over some outdoor Figs, I find the difference between those restricted at the roots and others that have unlimited space in which to ramble very remarkable, the young wood of the former being hard and short-jointed, and apparently uninjured by frost, while that of the latter is just the reverse. No doubt the past summer had been very bad for ripening such sappy growth, but the plants to which allusion is made are situated exactly alike, they being on a high south-east wall that is sheltered by others running from the ends and forming a square. They therefore stand the same chance, and may be judged fairly accordingly. From what I have had to do with Figs, I have come to the conclusion that to obtain fruit without limiting the ladder is a

hopeless task, for do what one will at the top by way of pinching and pruning it seems only to make matters worse, as Knifing only produces walking sticks, and does not check the naturally gross habit of the tree; but by cramping and confining the roots one soon becomes master of the situation, and can then keep the branches entirely under control.

Left to themselves Figs ramble far and wide, sending their thong-like feeders half over the garden, a striking instance of which I met with some years ago, when I found some had threaded their way into a Peach border, along which they had travelled nearly its entire length. In districts where Figs are found to be fertile they have a shallow dry soil resting on a chalk bottom, like that near Worthing, where in ordinary seasons heavy crops are obtained. The milder sea air that prevails there may have something to do with their fruitfulness; but then there are other parts just as favoured as regards climate, and yet we do not find the trees there anything like so prolific, for the simple reason that they run riot and make gross shoots full of pith that sell-on or never ripen. These as a natural consequence get severely injured by the frost, and the young embryo Figs perish from want of a flow of healthy sap to feed them, but it generally happens that the wood is killed outright. What is needful is to get this short and stubby, with joints not more than an inch or so from each other, as with such growth Figs are as hardy as the points of the branches of an Ash, and almost as firm and consolidated.

Like the straw of Wheat, the wood of Figs appears to require calcareous or flinty matter to build it up; and in planting, therefore, it is always advisable to work in plenty of fine chalk or lime rubbish, which, when mixed with the soil, should be rammed firm, so as to induce the formation of plenty of fibres—a point of great importance, as with a mat-like ball of these a fruitful habit must follow. The readiest and cheapest way of restricting the feeding-ground of outdoor Figs is to thoroughly concrete the bottom, or make it impervious to roots by a layer of bricks with the joints grouted in with cement, and to build a 4½-inch wall, so as to limit the soil they have to use to about a yard square. This, with the assistance of a heavy mulching during the summer, and a soaking or two of liquid manure or clear water when the fruit is swelling, will be found ample space for a large tree.

The best time to set about walling them in is during April when they are on the move, as then they stand the interference without feeling it in the way they do in the autumn with a hard winter at hand to contend with; and the check in spring is beneficial in bringing about the habit required. Root-pruning is generally a sufficient corrective as regards other fruit trees, but the Fig appears to get over an operation of that kind at once, and by the stirring of the soil often starts away again with redoubled vigour. I would therefore recommend the bricking in, as they are done with then once and for all, and I shall be glad to hear if any one else has tried the system, and what results they have met with by so doing. I have often thought that it would be a good plan of growing Figs to have a quantity in large pots or tubs that could be plunged in a warm sunny place in a bed of leaves during the summer, and in the autumn removed to a shed to be wintered: treated in which way they would be quite safe and yield an abundance of fruit. *Z. S.*

### VIOLETS.

THE sight of these at almost every turn, and the sense of their sweet odours, brings to mind that it is high time to be preparing for a winter supply, for to have them in quantity these plants must be propagated and set growing betimes. Like most perennials of this class, much of the success attending their culture depends on the length of season they have afforded them to make a full and free development of the crowns from which the blooms are produced. Unless these are formed there the year previous, it follows that they will be looked for in vain, for, however good the treatment after, they are like trees without bud, and must therefore be barren of blossom. To wait till May for runners makes it too late to get strong plants, and therefore the best way is to take up any old stock that has done flowering, and is healthy, and part the plants so as to single out and save all the finest side-shoots, which, although they may have no roots on at the time, will

soon make some if pricked out in pans or boxes and then placed in frames, where they can be kept close for a time, and syringed, to maintain the leaves in a fresh condition.

If the boxes or pans containing them are stood where they can get a gentle moist heat, all the better, as they strike the quicker; but as soon as this has taken place they must have air to prevent weakness and drawing, and must be gradually hardened off till they are fit to stand in the open bed, prepared after the following manner for their reception. As they are fond of vegetable matter, plenty of leaf-mould or refuse peat should be dug in, together with mild decomposed manure, in which mixture with the ordinary soil Violets specially delight. The site for the bed should be under the shade of some wall or building, quite away from the influence of trees, the roots of which otherwise soon find their way among the plants, and rob them to a serious extent. In putting these latter out, which should be done at 9 inches apart, it is important that they be disturbed as little as possible, as the less check they have the quicker will they set to work and establish themselves in their new quarters. During summer it is a great help to them if a mulching be given, the most suitable being sifted leaf-soil, which may be quickly scattered amongst them, when it will be found of great service in keeping the ground cool and moist by preventing evaporation, besides which it stops any washing of the surface soil when watering or applying liquid manure.

To concentrate the strength of the plants it will be necessary to remove all runners as they form; and to keep down red-spider there is nothing to equal cold clear water, sent with some force to the undersides of the leaves, so as to break up and destroy their webs, which ends in their complete discomfiture. Soot dusted on occasionally is a good antidote against these pests, and an excellent stimulant besides.

After trying a good many sorts of Violets for frames, I have arrived at the conclusion that there are none to beat the old Neapolitan either for delicacy of colouring or sweetness of perfume; but for all this the new double sorts are quite worth growing for the sake of variety to mix in with the others. S. D.

OPEN-AIR VEGETATION.\*

DURING the month of February the thermometer was at or below the freezing point nine times, while in February, 1879, it was twenty-one times. The following were the lowest temperatures: on the 6th, 30°, or 2° of frost; 9th, 23°, or 9° of frost; 11th, 25°, or 7° of frost; 13th, 29°, or 3° of frost; 14th, 29°, or 3° of frost; 15th, 28°, or 4° of frost; 26th, 30°, or 2° of frost. There were registered for the month 30° of frost, while in the corresponding month last year there were 68°.

Since March commenced the thermometer has been at or below the freezing point six times, and 25° of frost have been registered. The following were the three lowest readings: 8th, 25°, or 7° of frost; 9th, 23°, or 9° of frost; 10th, 23°, or 9° of frost; and this morning the thermometer stood at 35°.

The few bright sunny days at the end of last week and beginning of this had the effect of opening many spring flowers, and at present there are upwards of sixty different species and varieties in full bloom on the rock garden, among which may be noted:—*Andromeda floribunda*, *Galanthus Elwesii*, *pl. catus*, and *Imperati*; *Leucojum vernum*, *Saxifraga oppositifolia* (various forms, including *grandiflora*, *retusa nana*, and *pyrenaica*); *Rhododendron precox*, *Daphne Mezereum*, *Crocus Imperati*, *C. etruscus*; *Primula denticulata* (of various shades), *P. cashmiriana* (evidently a form of *denticulata*), *P. pulcherrima*, *P. purpurea*, *P. marginata*.

Of the forty species of spring plants whose times of flowering have been recorded yearly the following have come into flower since last meeting:—

	1879.	1880.
<i>Galanthus plicatus</i> .. ..	March 4	Feb. 23
<i>Bulbocodium verum</i> .. ..	April 7	" 26
<i>Arabis albida</i> .. ..	" 7	" 24
<i>Crocus susianus</i> .. ..	March 6	" 20
<i>Saxifraga grandiflora</i> .. ..		
<i>album</i> .. ..	April 6	March 4
<i>Draba aizoides</i> .. ..	" 7	" 4
<i>Daphne Mezereum</i> .. ..	" 9	Feb. 19

&c.; thus showing that vegetation is at present, on an average, at least five weeks in advance of what it was at this date last year.

\* Report on Temperatures and Progress of Open-air Vegetation at the Royal Botanic Garden. By Mr. John Sadler, Curator. Read at the March meeting (title) of the Botanical Society of Edinburgh.

In conclusion, I would call attention to a large addition which has just been made to the rock garden in the form of a fernery, in which has been planted nearly 2000 plants.

Foreign Correspondence.

MELBOURNE: January 1, 1880.—It may interest your readers to learn that an experiment, instituted by one of my assistants, has proved successful. He has been enabled to remove living *Livistona Palms* from the Illawarra forests to private gardens in Melbourne, the stems being about a dozen feet high, and very many years old. In accordance with precautions adopted by me in the Melbourne Botanic Garden many years ago when moving trees, the roots of these Palms were covered up at once when the ground around the ball of earth was cut, and the Palms left in their original positions for some months in order to form new roots. The Palms were after that lifted with some earth remaining adherent to the roots, and in that state they travelled well, wrapped up in coarse matting, for a week and more without flagging. Thus a villa here may at once be provided with stately Palms as much as twenty years old, or perhaps of any age, and that at quite an insignificant expense, and with the gain of a generation in time. This example might be tried in other Palm countries, and thus a new branch of horticultural trade might be opened up. Many of the Mexican, Brazilian, and Indian coast Palms might probably be shipped in a similar manner to European conservatories. *Ferd. von Mueller.*

Forestry.

VALUE OF SCOTCH FIR PLANTATIONS DURING FIFTY YEARS' GROWTH.—I quite agree with Mr. Smith that it is of no use for us to discuss the subject further on the present lines of divergence. As we started so we arrive, nothing gained, nothing lost. Mr. Smith relies upon what he finds in books and pamphlets for his information, while I go to the woodlands and forests for mine.

He finds certain statements in the books he reads, I find in the fields of my research nothing to confirm the book statements, but on the contrary everything to disprove them. Mr. Smith infers that my experience must be limited, the field of observation circumscribed, and that adverse circumstances, inclusive of bad management, must account for and explain the difference between what he finds in books and I find in practice. One or more of these circumstances may satisfy Mr. Smith as the solution of the problem, but if they do he will, I trust, by patience and investigation, find that his premises have been of false construction, and when he does so he will be angry, not with me, but with the books or authors who have put him wrong.

Mr. Smith is quite correct in saying that none of the woods or plantations under my management have yielded one half what he finds stated in books as yielded on other estates: he is also quite correct in saying that I have no prospect, or even hope, of any that I ever may have charge of ever doing so. Now that we mutually agree to conclude, or at least suspend the subject of our present discussion, I hope we shall be more fortunate in seeing eye to eye upon other and succeeding but kindred topics.

Believing that few, if any Scotch Fir plantations are mature and ripe as a crop below sixty to seventy years old, and that between the latter age and ninety years is found the period at which it is most profitable to cut and clear the crop, I will as opportunity affords adduce some statements showing the actual value of such crops in different parts of the country. The following is an extract from a small treatise on the culture of Larch plantations which I read some twenty years ago. The book I only had the loan of and noted some things, and although I have of late made several efforts to procure a copy of it I have hitherto failed in my endeavours, and shall be most thankful to any one who can direct me to it. The author's name is John Smith, and the book was published by Blackie & Sons, Edinburgh. I believe the book is out of print, but I would be glad to purchase a copy of it if for no other than the absurdities and exaggerations it contains, of which the annexed is an example.

On ordinary good ground there are planted

4000 Larch trees to the acre, at about 3½ feet apart. Thinning is commenced

At 9 years' growth, at which 500 trees are thinned out, at 1½d. each .. ..	£3 2 6
" 11 years' do., thin out 500 do., at 2½d. .. ..	5 4 2
" 13 .. .. 500 do., at 3d. .. ..	10 8 4
" 15 .. .. 500 do., at 4d. .. ..	9 1 3
" 18 .. .. 500 do., at 6d. .. ..	18 15 0
" 22 .. .. 500 do., at 1s. .. ..	25 0 0
" 27 .. .. 1000 do., at 3s. 6d. .. ..	165 0 0
" 30 .. .. 1500 do., at 10s. .. ..	75 0 0
" 33 .. .. 1500 do., at 15s. .. ..	112 10 0
" 49 .. .. 1000 do., at 25s. .. ..	125 0 0
Total produce of an acre of Larch in 49 years .. ..	£549 1 3

It is almost unnecessary to say that the above statement, though in print, is almost as far from the truth as it is possible to go; and yet such statements find credence by readers, to their own pleasure, no doubt, but certainly no less to their ultimate disappointment and loss.

I have now and again met with as specious fallacies as the above, but none more so that I can remember. C. V. Michie, Cullen House, Banffshire, March 15.

Garden Operations.

FLOWER GARDEN, ETC.

THE FROST.—Now that the worst effects are visible, shrubs and other plants that have suffered by the severity of the winter should have all traces of injury removed before new growth renders the operation tedious. With us *Laurustinus*, *Bays* and common *Laurels* are the most conspicuous amongst the injured, but for the most part it is only the later formed shoots that are destroyed, and all such we are having cut off; none of them seem to have vitally suffered, but doubtless in some parts of the kingdom this will be the case, or, if not, perhaps so much injured that the wisest course would be to cut them down to the ground-line at once. We are obliged so to treat *Arbutus Unedo*, *Berberis Darwinii*, and *Eunymus elegantissimus variegatus*, which seem hopelessly injured; amongst *Conifers*, *Pinus insignis* and *Abies lasiocarpa* are the only kinds that have suffered, and these only in a very limited degree, but as the browned shoots are eye-sore they should be cut off, which operation, to promote equality of growth, may render it necessary to shorten some few other shoots. The difference of opinion as to the occasional pruning of *Conifers* is inexplicable, for the operation ought to be regarded as a part of their culture, as much as when we endeavour to repress a strong watery fruit-tree shoot by pinching out its point to equalise growth over all parts of the tree. *Roses* have gone through the ordeal well, a few of the *Tea* section only have succumbed, and it is an instructive fact that the strongest plants, and consequently worst ripened, are amongst the slain. All kinds of *Roses* should now be pruned, afterwards the dry portion of the winter's mulching raked off, and the remainder lightly forked in; a fresh surface mulching should be given before the sun renders the surface hard and causes the soil to crack. *Cocoa-fibre* refuse makes a neat mulching, but before it is put on give a good dressing of guano, and this will carry them successfully through the summer.

THE BORDERS.—Shrubbery margins and mixed borders are now gay with *Snowdrops*, *Violets*, *Crocuses*, *Scillas*, *Primroses*, &c.; *Erica herbacea* being extraordinarily well flowered this season. *Daffodils*, *Myosotis*, *Phlox verna*, *Aubrietias*, *Arabis*, and the hardier annuals will also very shortly be in flower, and to enjoy their beauty to the full all the surroundings should be kept tidy; weeds, bad walks, and uncut turf, are sufficient to depress, even in the presence of his pets, the most enthusiastic floral devotee. Spring flowers are ever welcome, and I allude to and name some of them here, that their culture may be extended, and also to show that summer bedding is not the only phase of flower gardening I advocate or desire; indeed, I would prefer that all classes of hardy flowering plants had a place in every garden, but the formal parterre or a flower garden immediately in front of a mansion is not the place for them. All such gardens are most appropriately and effectively planted and maintained in neatness by the adoption of the bedding system, the providing of plants for which being just now the principal item in the labour programme.

BEDDING PLANTS.—To get up a stock of *Alternantheras* gives little trouble, when treated as detailed at p. 228; *Fresines*, *Coleus*, and *Heliotropes* require the best positions, and if possible should be potted singly, or at most but two plants in a 60-sized pot. *Lobelias*, *Tropaeolums*, *Petunias*, and the like, may be planted out in pits that can have full exposure as soon as the plants are established; whilst *Calceolarias*, *Violas*, and other half-hardy plants may be planted out in turf pits or under south walls, and be protected with mats in

frosty weather. Seedlings of subtropicals should be pricked out as soon as fit to handle, for if the roots once get matted together the check they receive by division is long in healing. The most beautiful and generally useful amongst this section of bedders that can be quickly raised from seed are *Kicinus Gibsoni*, *Acacia lophantha*, *Grevillea robusta*; *Solanum marginatum*, *pyracantha*, and *robustum*; and *Wigandia urens*. Abutilons are well suited for this kind of bedding, and cuttings of the following kinds struck at once will make good plants by planting time:—*Duc de Malakof*, *Lemoinei*, *Thompsoni variegata*, and *Boule de Neige*. As climbers, for vases and basket beds, sow seeds in warmth of *Cobea scandens* and *Maurandya*. Sweet Peas, *Convolvulus major*, and *Tropaeolum aduncum* (the Canary Creeper), may be sown at once in the place they are to occupy the entire season. *W. Wildsmith, Heckfield.*

#### HARDY FRUIT GARDEN.

The agreeable change which has taken place in the weather during the past few days has had a wonderful effect in forwarding the buds of fruit trees. So great has been the action of the weather in stimulating bud development in all stages and in all situations, that many operations that must have been behindhand, owing to the unpropitious state of the season, will now have to be brought forward with redoubled vigour. Planting has indeed been a work of difficulty, here at any rate, this season, the work having only been brought to a close within the past week. It should, however, be stated that the situation was a north one, in which position the soil is longer in getting into a workable state than it would be in a more exposed aspect. A rather open soil on the light side, and perfect drainage are the most efficacious remedies to apply with a view to early fertility in such positions. Espalier trained Pear and Apple trees, which from the nature of their position are rendered conspicuous objects, should be well mulched, and the surface blinded over with soil to hide what is in the eyes of some an objectionable appearance. No digging about their roots and no hungry plants robbing them of their daily bread ought to be on any account permitted here. The advanced state of Peach and Nectarine trees will cause a considerable display of activity upon walls where pruning and nailing are still in arrear. Leave the best bearing shoots, and do not be afraid to use the knife upon weakly, immature, or succulent growths, which, however, seldom exist where summer pinching and thinning is carefully attended to. Trees that are swarming with weakly shoots and buds about half their normal size are indicative of neglect or lack of knowledge, and never bear fruit that are fit to look at, much less to eat.

Morello Cherries will now require attention, and will have to be pruned and nailed, whenever time can be afforded from work that is more urgent. The Morello bears its fruit upon the shoots made last year, the best of which should be laid in, bearing in mind also that enough space must be left between the branches to admit of a sufficient quantity of young growths being retained during the coming season for fruiting next year. Gooseberries and Currants grown upon north walls for late dessert purposes may also be pruned, and a net thrown over them to protect them from birds. Fig trees upon open walls have suffered more than I ever remember, and it will be prudent to defer pruning until it can be clearly seen which shoots promise to be most prolific; the trees here on a south wall are moving slowly, and a practised hand might prune with safety. Vines have also suffered severely; the buds which are cosily ensconced at the base of the shoot close to the wall are swelling gradually, but the wood generally is green, and the buds inferior in size. There will be little choice left in the matter of Vine pruning out-of-doors this season; it will be more a question of looking out for shoots pushing from latent eyes to furnish the walls afresh with. With regard to the protection of fruit trees now fast coming into flower the usual preparations will have to be made at once. Apricots are beginning to open their blossoms, and Peaches and Nectarines are not far behind them. The best and most successful protection I ever saw, short of glass, was one made out of a ship's sails. It was brought into use by the gardener of a Liverpool ship-owner, who had it fixed on the top of the garden wall in a very workmanlike manner. It worked up and down by means of pulleys and cords, and was used as frequently to retard blossoms as to protect them. It was let down during the hottest hours of the day in order to regulate the great discrepancy of temperature that frequently supervenes, on the cooling down after those hot, dry blinks of a March sun. It was kept a considerable distance from the wall by placing poles equidistant obliquely against the wall. It protected the fruit blossom from wet, frost, extreme cold, and also modified the heat which in hot weather could only be maintained in a proportionate ratio at night by means of glasshouses and hot-water pipes. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

VINES.—Never within the range of my experience have Vines, early and late, broken kinder and better than they have done this season. Non-fermenting material advocates will attribute this satisfactory state to the discontinuance of artificial heat to external borders; but twenty years' experience in a low, damp situation, unfavourable to the growth of good Grapes, leads me to infer that, notwithstanding the severity of the frost, a dry, cold winter is less injurious to the roots than a mild, wet one; moreover, that when covered with some frost-resisting material the borders continue several degrees warmer than they do when clogged by heavy autumnal rains, which chill the roots and prevent the air from getting into them. This being the case it becomes doubtful if many of our Vine borders are not made much deeper and wider than is absolutely necessary to the well-doing of the Vines. At this place, whenever I find a house of Vines going back I always have one remedy, namely, the removal of external or internal borders, shortening of the roots and relaying in new compost, consisting of rough turfy loam and old lime-rubble, manure being used as a mulching only. When treated in this way the wood in the latest houses ripens well, compact handsome bunches follow, and the berries invariably colour and finish satisfactorily. Where spring planting is contemplated the situation and surroundings should be the guide; if high and dry the borders may be 2½ to 3 feet deep, but in low situations 2½ feet will be sufficient. They need not exceed 4 feet in width, and the Vines should always be planted inside the house. Vines in a growing state that have been cut back can then be put in, and if the compost, as suggested in my last paper, has been properly warmed, they will grow away at once, and fill the house with fruiting wood before the end of the season. It will be greatly to the advantage of the Vines if the narrow borders inside and out can be mulched with short manure, which should be kept moist to induce the roots to run along the surface in preference to their striking down into the drainage in search of food, as vigorous young Vines when in full growth take immense quantities of water. Thinning in the early house will now be finished, and the bunches, by their increasing size and weight, will tax the energies of the Vines, especially as the atmosphere is clear and dry. To assist them over the stoning period, all inside borders should be well mulched with good rotten manure, and alternately watered at short intervals with tank liquid and guano-water. The floors and paths may also be damped with liquid after the house is closed, but day and night ventilation must be liberal in proportion to the degree of high feeding. Keep up a circulation of warm air where Grapes are setting. Let Hamburgs have a minimum temperature of 65°, with an allowance of 5° more to Muscats, Mrs. Pince, and Black Morocco. Fertilise these with Hamburg pollen when the temperature has reached the maximum on fine days. Remove the remains of all fermenting material from internal borders, and proceed cautiously out-of-doors, as a great number of valuable feeders will be working on the surface, and therefore the covering must be removed piecemeal. Give copious supplies of good liquid to pot Vines swelling off crops of fruit. Pot on young ones of this year's propagation when they break away freely into their second growth. Replunge in bottom-heat, slightly shade for a few days, and afterwards expose to sun and light. *W. Coleman, Eastnor.*

#### MELONS.

These have made rapid progress during the bright sunny weather with which we have been favoured during the last fortnight or three weeks. The stopping, tying, and thinning of the shoots must be attended to almost daily, now that the plants are in active growth. Remove all blossoms, male and female, from the plants swelling off their fruits in the early house or pit, which should have the supports put to them in due course, in order to relieve the plants of the weight of the fruit. For this purpose some growers use pieces of deal or lime boards about 6 inches or 7 inches square, and half an inch thick, suspended in a sloping direction to prevent the lodgment of water, by four pieces of wire from the trellis, whilst others use square pieces of small meshed garden netting, which is fastened to the trellis by four pieces of string. Perhaps the latter kind of support is the simpler of the two, inasmuch as it will not exclude any light from the fruit, and being elastic it yields to the pressure of the fruits, and is readily made. Examine the soil and see that the plants do not suffer for want of water. They will now most likely, especially if the roots are growing in a rather confined space, be in a condition to take a weak application of liquid manure, and in giving it them avoid watering close to the stem, which brings on canker, as a preventive of which place a little dry soot and lime around the stems of the plants, say within 3 or 4 inches, and should canker appear, close to the stem. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

Tying, stopping, and thinning the shoots, and removing superfluous fruit, will be the order of the day in this department. Also liberal and frequent supplies of tepid liquid manure in a diluted state must be given to the roots of plants swelling off their fruits, especially to those having their roots in a somewhat confined space, such as pots and boxes. Ply the syringe freely through the plants both ways, so that every portion of the foliage may receive a good washing every morning and afternoon during favourable weather, which, with judicious ventilation and sufficient water to the roots, will keep red-spider at bay. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

CONSERVATORY CREEPERS.—Roof-climbers of all descriptions will now be on the move, and in the case of *Passifloras*, *Mandevilla suaveolens*, and *Tacsonias*, which flower on the young growth as it forms, it is high time that all the shoots of last year were pruned hard back to the main stems or spurs, leaving only such as are absolutely required for the purpose of laying in to fill vacant spaces, as the less of the old wood that remains the better and fresher will they look. Beautiful and desirable as the *Tacsonias* are, especially *T. exoniensis* and *T. Van Volxemi*, it is very rare that they can be kept long in a house without becoming affected with scale, a pest to which the bark is particularly subject. If this be scrubbed, or brushed over, or thoroughly wetted with a solution of nicotine soap, or Fowler's Insecticide, it will be so effectually cleansed that it will remain tolerably free for the rest of the season. As regards *Tecoma jasminoides*, and the different varieties of *Bignonias*, what thinning they require should be left to a later period, for as yet it is impossible to distinguish between the growths that will bloom and others that may be spared to cut out. The first-named, when planted in a border with unrestricted root-space, is generally very shy; but by confining it, and training the top where it can be exposed to the full influence of sun and light, it is exceedingly floriferous, and one of the finest ornaments that can be had, the foliage being of that description and character as to be in a healthy bright condition at all times of the year. To show up in pleasing contrast with its deep green leaves, *Cobea scandens variegata* is one of the best things to plant, and particularly so where the roof is at all lofty, so as to admit of the shoots depending naturally from the girders; in which way, if judiciously thinned and regulated, all climbers appear to the greatest advantage.

CAMELLIAS.—It often occurs that when *Camellias* are planted out in these structures they soon outgrow their allotted space, and when it is necessary to prune them it is very important that the work be taken in hand immediately the blossoms fall, for after the plants are lightened of their load active growth takes place at once, and if the cutting back be deferred till then it is impossible for the branches to break as freely and vigorously as they otherwise would. To aid the dormant buds in starting it will be found a great help if the heads can be syringed morning and evening, and the temperature raised by shutting the house up early, by which means, too, a genial atmosphere will be formed of a kind that *Camellias* specially delight in. Pot plants may be easily treated by removing them to situations where they can enjoy the above-mentioned conditions, and as the sun is now bearing some considerable power when it does get through the clouds, it will be necessary to shade for a few hours during the heat of the day. When the young shoots have fairly made a start, weak liquid manure will be of great assistance if given about twice a week, as by its use plants may be kept in health for years with very limited root-room. Where it is desirable to repot, the present is a good time for doing it. It is an operation that requires great care, the active feeders being always of a remarkably brittle nature, and therefore very susceptible of injury. The soil best adapted for their culture is pure yellow fibry loam, chopped up and used somewhat rough, with just sufficient sharp sand to keep it porous. *Camellias* do well, too, in a mixture of loam and peat, some growers preferring this, but although the plants make wood perhaps a little more freely, it is a question whether it produces an equal amount of bloom, though being less firm and compact. Having such a galaxy of flowers just now wherewith to make a show, one is apt to be forgetful of the future; but to keep up a continuous display we must be looking ahead, and so managing as to keep back some and to push on others, that they may be had in at any special season desired. As a retarding place a north house is most valuable in any garden, for in it plants may be stooled, and brought on in such a gradual manner as to throw them back at least a month out of their ordinary course, but the check given should be during the early stages of the swelling of the buds. *J. Sheppard.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 22	Sale of Established and Imported Orchids, at Stevens' Rooms. Sale of Established Orchids, Lilies, &c., at the Mart, by Protheroe & Morris. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at D.A.M. Scientific Committee, at 3 P.M.
TUESDAY,	Mar. 23	Sale of Imported and Established Orchids and Japanese Lilies, at Stevens' Rooms. Sale of Roses, Fruit Trees, Camellias, and Azaleas, at 38 and 39, Gracechurch Street, by Protheroe & Morris. Royal Botanic Society's Spring Show.
WEDNESDAY,	Mar. 24	Sale of Imported Orchids, from Messrs. H. Low & Co.; Roses from France; Plants from Holland, &c., at Stevens' Rooms.
THURSDAY,	Mar. 25	Sale of an Importation of Rare Orchids, from Mr. F. Sander, at Stevens' Rooms.
FRIDAY,	Mar. 26	Paisley Horticultural Society's Show.

THE present spell of fine weather may do much to wipe out the retrospect of the terrible winter that we have passed through. What was in 1879 called by courtesy summer was more like an ordinary November, and it was, as our readers have too good cause to remember, wedged in between two winters of almost, if not wholly unsurpassed intensity and duration. If the "good old times" we hear so much about were like these we think the sooner they are confined strictly to the domain of memory the better. Experience, however, has shown us that we must expect the occasional occurrence of such adverse seasons, and that nothing we can do will avert them.

It does not follow, however, that because we are powerless to avert them we are to sit still with our hands before us. And as a matter of fact, we do not: we mat up, we bank up the fires, and by-and-bye we shall turn on the electric light, and thus gain additional means of obviating the ill-effect of gloom and cold. So there is some chance, at least, that the "good time coming" will after all be better than the good old times. But if our means of defence are better than those possessed by our forefathers our risks are greater and the flock we have to tend is tenfold larger. There are more plants known in gardens now than ever LINNÆUS knew in his cabinet of mummies. And who shall estimate the gain to humanity in one way or another from this large access of new plants? The task is beyond the power of art. What is not beyond our faculties is the power of selection—of choosing what is good and suitable for our purposes, and of rejecting or relegating to the herbarium what are not adapted for our gardens, fields, or forests. Such seasons as we have had lately, in spite of all their evil consequences, may at least be turned to good account by teaching us what to grow and what not to grow. For our own part we would rather grow and lose than not grow at all. But in many cases loss is not a mere enforced change of one pet plant for another, it means severe distress, possibly ruin, and therefore it is of the utmost importance that the lessons of the two past winters and the intervening hybrid—we will not call it summer—should be gathered together, compared and weighed. Every carefully recorded fact as to the influence of the season on plant growth is of value. What may have no direct or immediate practical bearing may yet be useful from an abstract scientific point of view, and if so its ultimate practical value is a matter of certainty. We would urge then upon our readers the desirability of forwarding to us observations on the effect of the winter on various descriptions of plants. The observations should indicate concisely and briefly the degree of injury—slight, severe or mortal, as the case may be; and should be accompanied by a general statement of the

local conditions, such as soil, water, altitude, together with any general observations that may be deemed requisite. It is specially desirable that lists of Roses, Broccolis, and the like, which have survived these adverse conditions, should be drawn up as a guide for the future.

The French, who, like the Belgians, have suffered far more severely than ourselves, are bestirring themselves by issuing a circular, the only objection to which that we can formulate is, that it is too minute for busy men to fill in or for busier men to tabulate. It seems to us more profitable to get a comparatively few well defined precise statements respecting well-known or commercially important plants from different localities than a vast number of loosely-recorded data not admitting of comparison, and many relating to plants of limited interest, scientific or practical. We believe that, under the auspices of the Scientific Committee, a circular will be drawn up and forwarded to various observers throughout the country, and it is with the view of facilitating the objects of the committee that we would request our readers to record their observations, which will then be in a form readily available for the purposes of the committee.

— PTELEA TRIFOLIATA (fig. 67).—This is a hardy North American shrub, which is less known than it deserves to be, though in truth an old inhabitant of our gardens. As an ornamental shrub or small tree its loose habit is somewhat against it, but its foliage is striking in form, rich green in summer, and bright yellow in autumn. The flowers are inconspicuous, but they are succeeded by winged seed-vessels traversed by branching veins, which are very attractive. They so much resemble the fruits of the Elm that the Greek name for Elm has been applied to the tree. Botanically it has nothing to do with Ulmus, but is a member of the great Rue family, Rutaceæ. Of late the bitter fruits have been proposed as a substitute for Hops in the brewing of beer, but as this is an old notion revived, it is to be presumed the experiment has been tried and not found commercially successful. If once a sufficient stock were obtained, there would be no difficulty in growing a crop with probably less risk than in the case of the Hop, which last season was an utter failure, in spite of the great cost of production.

— TURNIP-TOPS.—It would no doubt be regarded as a joke were we to assert that there was an intimate connection between the sudden dissolution of Parliament and the price of Turnip-tops, but how otherwise is the extraordinary fall from 2s. or 2s. 6d. per bag at the beginning of the previous week to the miserable figure of 6d. at the end of the week to be accounted for? Even the Funds could not be more adversely affected, and if the Prime Minister's act is really the actual factor in this case, then has the already greatly distressed agricultural interest another reason for complaining. In the immediate metropolitan district Turnips have been few and patches rare, therefore the farmers for once had a chance to turn their field crops of this useful vegetable to good account. A good profitable price was obtainable, and the heart of the poor farmer for once was gladdened, when lo! a dissolution sets all the country agog, public credit is affected, and speculators become fearful even of Turnip-tops, therefore down they go 150 per cent., and heavy loss and disappointment are the result. It is all very well to say that this is nonsense; how else is the result to be accounted for? The supply has not suddenly quadrupled, the consumptive power of the average Londoner for Turnip-tops remains the same, therefore why the sudden fall? If not due to want of confidence, then does it arise from the changed nature humanity shows when it is brought under the exciting influence of a general election? All ordinary observers have noted that just then even the sanest and soundest of men go politically mad, and for the time suffer under the influence of strong party mania. Does humanity in that condition find its Turnip-tops as repugnant as the mad dog does water? Here is a nut for the mad doctors to crack; but, whatever their verdict, it can hardly bring much comfort to the unfortunate speculator in these seasonable greens.

— TO OUR CORRESPONDENTS.—The Publisher desires us to state that as Friday next, March 26, will be Good Friday, the *Gardeners' Chronicle* will be published on the previous day, and desires that advertisements intended for that number should reach the office not later than Wednesday morning. Our correspondents will also greatly oblige by forwarding their communications one day earlier.

— THE ROYAL SOCIETY.—This venerable society has set an example which will doubtless be followed by other learned bodies, of holding its meetings in the afternoon. On the first meeting after Easter (April 8), and for the remainder of the session, the hour of meeting will be half-past 4 in the afternoon, in place of half-past 8 in the evening—a boon to those who reside in the suburbs.

— SHRUBS IN FLOWER AT KEW.—The following are some of the most noteworthy shrubs now in flower in the Kew arboretum. The Japanese *Lonicera Standishii*, the earliest flowering of the Honeysuckles, is remarkable for its deliciously scented creamy white flowers. It is a shrubby species, which can hardly be called a climber. The golden-yellow blossoms borne by *Forsythia suspensa*, equally profusely by plants on walls, in the mixed shrubby border, or in isolated positions, render it one of the most valuable of early flowering shrubs. Amongst *Rhododendrons* the most magnificent of all the Himalayan series is *R. fulgens*, which with the gorgeous hue of its flowers surpasses all the other species of the genus. This seems to do well at Kew in the open air—better than most, if not all the other Himalayan ones. Its discoverer, Sir JOSEPH HOOKER, calls it "the richest ornament of the alpine regions" (of Sikkim), where on the bleak mountain faces, at elevations of from 12,000 to 14,000 feet, immediately overhung by the perpetual snow, it is at all times conspicuous. The small neat-growing *R. dahuricum*, from Siberia, with its small purple blossoms, merits attention by reason of its good habit and free flowering.

— PROFESSOR BELL.—The older Fellows of the Linnean Society will hear with sympathetic regret of the death of one of their former Presidents, whose suave courteous manner and dignified bearing well became the office. Previous to holding the presidency of the Linnean, he had been secretary to the Royal Society for some years. As a naturalist Mr. BELL was best known for his researches on the Crustaceans and on the Mammalia and Reptilia, but in truth he was an active, clear-headed worker in many departments of zoology, inasmuch that one of the German societies, the Casarian Academy "*Naturæ Curiosorum*," and whose custom it is to bestow a cognomen on those whom they admit to their Fellowship, bestowed on BELL that of LINNÆUS. Some years since Mr. BELL retired from his profession as a London dentist, in which he had achieved the foremost position, and took up his residence at Selborne, in GILBERT WHITE'S very house. No fitter tenant could possibly have been found; and although we cannot overlook the value of BELL'S other services to natural history, we think it may well be said that the greatest benefit he ever rendered to it was the publication of his edition of WHITE'S *Selborne*. This edition we reviewed at some length at the time of its publication, and we may still say of it that the charm of the book was literally doubled by its latest Editor. Henceforth there should be but one edition of this standard book—BELL'S. Professor BELL derived his title from King's College, London, where he was Professor of Zoology. For many years, however, the title was merely nominal. He had also for many years a professional connection with Guy's Hospital. Professor BELL, who in former years was an occasional contributor to our columns, died on the 13th inst., in his eighty-eighth year.

— EPIDENDRUM MACROCHILUM.—Several specimens of a fine variety of this somewhat variable Orchid may now be seen in flower in the Kew collection. In point of size of flower *E. macrochilum* probably takes the lead over all the other species of the genus. In the Kew plants the sepals and petals are of a dingy purplish colour, tipped with green; but the large rose-coloured lip makes up for lack of brighter shades in the narrow sepals and petals. In addition to its beauty the species possesses another recommendation in its agreeable odour.

— A SPOTTED ANTHURIUM.—In 1876 Mr. BERGMAN, gardener to Baron ROTHSCHILD at Ferrières, fertilised some flowers of *Anthurium Scherzerianum* with the pollen of *A. Williamsii*, and ultimately raised a batch of twenty-five seedlings, all of which, except four, proved to be only good forms of *A. Scherzerianum*; while the four in question proved to have white spathes nicely spotted with red, and the habit of the plants resembling that of a vigorous type of *A. Scherzerianum*. The plant was shown in Paris on the 11th inst., at a meeting of the Central Horticultural Society of France, and the exhibitor was awarded a "Prime de première classe" equivalent to a First-class Certificate.

— BRITISH ALGÆ.—Mr. E. M. HOLMES brought before the Linnean Society (March 4) a new British Alga, *Codiolum gregarium*, A. BRAUN, discovered at

on as much Prickly Pear as they would eat. A few years ago farmers were spending fortunes in clearing it off their farms, in fact they looked upon it as a most useless plant and a regular curse, as it killed so many cattle when they ate it when everything else was dry. The case is now quite different—the plant is looked upon as a real blessing. On the very farms where hundreds of pounds were spent in getting rid of it, it is now being planted, and is valued on account of the ease and rapidity of its growth.

— CORYDALIS ILDEBOURIANA.—This newly introduced and pretty species is now blooming at Kew; it is a thick-stalked, dwarf plant, with ternately divided glaucous leaves, and a leafy raceme of pinkish flowers. It will, doubtless, prove a valuable addition to our list of herbaceous plants. It is a native of the south-east districts of Altai, and no doubt will prove

proving a valuable decorative plant. It much resembles the variety *Baronne James de Rothschild*, raised by the same firm, but the colour is pure ivory-white and green, instead of the red and green of the last-named plant. The leaves are very large, and round at the tips, and the plant is a free grower. *Croton Carrierei* comes from a cross between *C. Hookerii* and *C. Veitchii*, and has long green leaves, with middle and side lines of yellow.

— DIOSPYROS KAKI.—At a meeting of the Central Horticultural Society of France on the 11th inst., M. DUCHARTE gave some interesting facts concerning the species of *Diospyros*, and especially of the *Diospyros Kaki* of the Japanese. This tree has been planted in Algeria, and some fruits were some time ago sent to the Society for tasting, which were pronounced uneatable. It was afterwards

FIG. 67.—*PTELEA TRIFOLIATA*. (SEE P. 368.)

Teignmouth by the Rev. R. CRESWELL. Mr. HOLMES believes that the hypno-spores described by BRAUN do not belong to *Codiolum*, but to another Alga usually found growing with it. The growth of the plant and its fructification, contrary to BRAUN'S supposition, lasts through the winter and spring. Mr. HOLMES also exhibited specimens of the fructification of *Chaetopteris plumosa*, found in Britain for the first time by Mr. J. W. TRAILL, of Edinburgh. The unilocular sporangia, in this instance, were in a more advanced stage than those figured by ARESCHOUG, and the multilocular sporangia differed in character from the illustration given by the last-mentioned Swedish authority.

— THE PRICKLY PEAR IN OSTRICH FARMING.—A correspondent of *Land and Water*, dating from Cape Colony in January last, draws attention to the use of the Prickly Pear in ostrich farming. Owing, he says, to extreme drought from which the springs and dams were all drying up, the ostriches had to be fed

perfectly hardy in this country. *C. Kolpakowskiana*, an allied species of similar habit, is also in fine flower; it has dark purple-red flowers with a paler spur. Judging from the figure given by REGEL in *Gartenflora*, the Kew plant is the variety *purpurea*, as the type (by far the commoner plant) is represented as being much paler and less handsome. This has withstood the St. Petersburg winters without any protection, so its hardiness in England cannot be called in question. It was discovered by ALBERT REGEL in Kuldsha.

— TWO NEW CROTONS.—We learn from a French correspondent that at the meeting of the Central Horticultural Society of France, held on the 11th inst., MM. CHANTRIER *frères*, nurserymen, of Mortefontaine, exhibited two of their best new Crotons, *C. Bergmanni* and *C. Carrierei*, and received an award equivalent to our First-class Certificate. *Croton Bergmanni* is the result of a cross between *C. maximus* and *C. Veitchii*, and gives promise of

ascertained, however, as is well known here, that to be good the fruits must be eaten when they are in the same condition of ripeness as Medlars, as specimens from the same sample tasted six weeks later were reported to be delicious. Under these circumstances it is not unlikely that *Diospyros Kaki* will be largely planted in Algeria, and prove a good source of revenue to the growers in that colony. It appears that some varieties of *Diospyros* are more robust than others, proving hardy even where the sea freezes. When planted the trees require but little care.

NEW FRUIT AND VEGETABLE MARKET.—On Wednesday afternoon the foundation stone of the new London Central Fruit and Vegetable Market, which is about to be erected by the Corporation of the City of London on a site immediately adjoining the Meat and Poultry Markets at Smithfield, was formally laid by Mr. Deputy LOWMAN TAYLOR, J.P., the chairman of the Markets Sub-Committee, in the presence

of a number of leading citizens. The building will occupy the present excavated area at the west end of the Central Poultry Market, fronting four streets or roads, viz.,—Charterhouse Street, Western Roadway, New Southern Roadway, and Farringdon Road. The general principle adopted in the arrangement of the plan is to make the main floor of the market as near as possible the level of the Poultry Market, so that the entire range of markets is readily approachable the one from the other. There being a difference of level of some 10 feet between the Western and Farringdon Roads, the main entrances to the market area are placed—first, that on the east, opposite the western entrance to the Poultry Market; second, that on the north, in Charterhouse Street, near the corner of Western Roadway; and third, that on the south, in the Southern Roadway, in a corresponding position to that in Charterhouse Street. The floor of the market will be level, a slight gradient being necessary only at the several entrances. The plan of the market shows an area of nearly 44,000 feet devoted to wholesale market purposes, surrounded by forty-one shops fronting the several streets, which can be used for retail or other purposes, and these occupy an area of some 16,800 feet. The general, or market area, is approached by the three main or vehicular entrances, as before stated, and by two further entrances for foot passengers from the Farringdon Road corners of Charterhouse Street and Southern Roadway. The market consists of a series of shops, thirty-three in number, having in front pitching stands for goods and waggon stands; the whole approached by a roadway having a width of 18 feet, always clear for vehicular traffic. In the middle of the market area is a further arrangement of pitching stands, with an area of about 4400 feet, including gangways. The basement is suitable for both market and railway purposes. The cost of the building is estimated, including land, at £290,000. The Corporation reckon upon an income from the market of nearly £17,000 a-year, and if this expectation is realised there will be a considerable profit after payment of interest on loans and working expenses. The stone was laid by Mr. Deputy LOWMAN TAYLOR with masonic precision, and in a cavity in it a vase with the coins of the realm and a copy of the *Times* of that day and of the *City Press* was deposited.

— **HELP FOR THE IRISH.**—We understand that Messrs. SUTTON & SONS, of Reading, have presented 100 bushels of their Magnum Bonum Potato to Mr. E. PURDON, of the *Irish Farmers' Gazette* Peasants' Seed Potato Fund, besides a large quantity of the same variety to the Irish Church Mission at Connemara, for distribution among the distressed inhabitants of that district. The Messrs. SUTTON have also contributed £100 to the Duchess of MARLBOROUGH'S Relief Fund.

— **PRIMULA SINENSIS.**—Mr. BULL sends us a box of blooms of *Primula sinensis*, containing some interesting forms of this now beautiful and much varied species. They represent certain stocks now being grown for seed on his account in Italy, and are mostly of large size and well filled. The following are amongst the larger single varieties:—Village Maid, white, prettily flecked and striped with rose, small yellow eye; rubra, magenta-rose, with the yellow eye margined with a deeper bronzy tint; alba, blush-white, with conspicuous yellow eye; kermesina splendens, a good form of the carmine-tinted form to which we probably owe all the recent high-coloured sorts; lilacina albo-marginata, pale lilac, with yellow eye and white edge. A smaller flowered sort, called alba luteo-oculata, is white, with a very large yellow eye varying in shade from greenish-yellow to a deep golden hue, the flowers as yet wanting in smoothness. Three interesting semi-doubles make up the collection:—rubra flore-pleno, alba flore-pleno, and kermesina splendens flore-pleno, in which the colours are as in the single flowers noticed above, but the yellow eye is replaced by a tuft of petaloid bodies. The advance made in these flowers has been very rapid of late; and the advent of still more brilliant colours, such as is seen in the varieties named Chiswick Red and Meteor, will secure for them increased popular favour.

— **THE SEED SUPPLY (IRELAND) ACT.**—A Dublin correspondent writes:—"Now that the time for sowing the land is so near at hand, and as so many farmers (particularly the smaller ones) have been

unable to save any of last year's seed for present use, it may be well to draw attention to the above Act, which has just become law, and which may, if timely taken advantage of, be productive of great good. As the Act has been considerably amended since its introduction, an outline of its final provisions may prove acceptable. The Act can be applied in any Union which the Local Government Board has scheduled. The Board have sent circulars to the Unions that are scheduled, but the amount of seed which the Guardians can now allot is not correctly described. It cannot be too generally known that, if any Union which has not been placed on this special schedule applies for either the whole Union or a portion to be placed under the Act, the Local Government Board has power to so place it, and the Local Government Board and the Irish Government are disposed to use this power. The powers given to the Unions which are not thus scheduled are to make contracts for the supply of seed, and to issue to all occupiers rated at £15 and under sufficient Potatoes to sow a statute acre, and sufficient Oats to sow another statute acre. They have further power to issue other seed in lieu of Oats, but in this case a previous application to the Local Government Board is advisable. The total value of seed issued to any one person is limited to £5. There is also a clause by which the Guardians are empowered to supply seed to cultivators who are not, legally speaking, "occupiers," that is, to labourers, or to men taking an acre. In these cases the supply of seed is limited to a quarter of a statute acre of Potatoes, and such seed will not be issued unless the occupier becomes security for the payment. This seed is to be paid for by farmers in two equal instalments: the first to be levied by a special rate struck before October 1, 1880, the second before October 1, 1881. It is absolutely necessary that the lands should be immediately prepared, as the Guardians are only authorised to issue seed for "prepared" land. If the Guardians of any Union are not willing to put the Act in force, an authenticated letter may be sent to the Local Government Board, who have the power to work the Act themselves, should the Guardians refuse to do so."

— **THE WINTER IN RUSSIA.**—An English gardener in Russia ("J. F. M."), writing under date of March 9, remarks that while the frost has done so much damage in England, France, and elsewhere, the winter in the western part of Russia has been the mildest remembered by the older men. Only on five nights was the thermometer below zero—between November 8 and February 20 "we had frost every night, but seldom more than 16° or 20°." On November 6 there was a fall of 6 inches of snow, but up to February 20 we scarcely saw a cloud in the sky. Nearly every year there is a 2 to 3 feet fall of snow, which keeps our dwarf Roses and low-growing plants safe; but this year they want their covering, and no doubt the effects will be seen soon enough. Dry Fern is plentiful here, so we cover up all tall Roses, small Apples, Pears, Plums, and Cherries, which seem to have passed safe as yet."

— **PROTECTING PLANT-HOUSES IN RUSSIA.**—The same correspondent also writes:—"Covering plant-houses is not considered necessary in England, but it is so here, in western Russia. Although the past winter has not been much severer than I have seen in Scotland and England, we cover every night if there is more than 6° of frost. I can testify to its advantages. The fires are done up for the night at 9 o'clock, and are not seen to again till 7 o'clock the next morning; and we can keep up a more regular temperature with a great saving of fuel. The covering for large houses generally consists of boards about 15 inches wide, or blinds, but the latter are very apt to get torn, or otherwise get out of order. For small houses shutters are the best, as a greater length can be put on at a time, and in spring they are used for protecting wall-trees from frost."

— **HYACINTH SHOW AT THE EXETER NURSERY.**—Three years ago Messrs. LUCOMBE, PINCE & Co. started an exhibition of Hyacinths, and offered several prizes for the best collection of these beautiful flowers. The first exhibition proved so successful that it has now developed into an annual institution, and each year it seems to grow in favour. The exhibition for the present year was held on the

12th inst., at the Nursery, and was of such a character that it must have gratified the promoters, as well as the large body of the public who visited the show, and who at the same time were afforded an opportunity of viewing the forcing-houses and the varied collection of shrubs and trees. The firm offered prizes for two competitions, and a fair number of entries were forthcoming. The exhibits were staged in the principal conservatory, which was so arranged as to present a most attractive appearance. This structure is divided into two portions, and the one which the visitors entered first contained a beautiful collection of Palms and Tree Ferns, exhibiting almost every shade of green. The higher part of the building presented a striking contrast, for the shelves on each side were laden with bright flowers of various kinds, set off by a fine collection of *Richardia aethiopica*, which formed the background. In the first class for twelve distinct varieties of Hyacinths, the 1st prize was awarded to Mr. G. H. CHAPLIN, of Fordton, Crediton (Mr. OUTRAM, gr.), who had a very fine collection; and the 2d prize to Mr. ROWE, of Lafford, Exeter (Mr. BARER, gr.). Mr. ROWE, like Mr. CHAPLIN, has been a previous prizetaker, and he also exhibited a nice collection. Though only two prizes were offered, the collection shown by Mr. HENRY WARD, of Budleigh Salterton, was considered by the judges to be so meritorious that it deserved an extra prize, and the firm, acting on their suggestion, awarded it one. In the second class, six varieties, the 1st prize was taken by Mr. OUTRAM, Crediton, and the 2d by Capt. WALDY, of Howden Court, Tiverton, both of whom had good collections. Messrs. LUCOMBE, PINCE & Co., also exhibited, but, of course, not for competition.

— **ROYAL HORTICULTURAL SOCIETY.**—We understand that there is every prospect of the show to be held in the large conservatory on Tuesday next being an exceptionally good one. Messrs. J. VEITCH & SONS hope to exhibit a splendid group of *Amaryllis*, comprising nearly 400 plants, the greater number of which are of their own raising. Capt. PATTON, St. John's Wood, intends to exhibit about 200 Hyacinths and other plants.

— **TEA ROSE VISCOUNTESS FALMOUTH.**—Of this charming novelty, raised by Mr. BENNETT, of Stapleford, fresh blooms are to hand, and nothing in the way of a cut Rose can be more lovely. The deep green glossy foliage is a clear indication of its Tea parentage. The flowers are of a bright deep rose colour, paler towards the base of the petals, full and globular in shape, with a most powerful and delicious scent—the true odour of Roses. As an addition to the high-coloured section of Tea or Hybrid Tea Roses, whichever it is decided to call them, this variety will be most welcome and most valuable; and Mr. BENNETT well deserves the thanks of all rosarians for the new pleasure he has thus put before them.

— **LIVERPOOL HORTICULTURAL ASSOCIATION.**—The great summer show of this new Association is announced to be held on Saturday, July 31, and Monday, August 2. We are glad to see that the new Association, which only held its first show last year, is in a very healthy condition, the balance in hand at the commencement of the present season being nearly £190. The total amount received in connection with the first show was £740 16s. 9d.

— **THE WEATHER.**—General remarks on the weather during the week ending March 15, issued by the Meteorological Office, London:—"The weather, though foggy or hazy at the southern and south-eastern stations, has been generally fine and very dry over England; cloudy and rather rainy in Scotland; and dull and showery over the greater part of Ireland. The temperature has been about equal to the mean in "England, N.E.," but a little above it in all other districts. The highest readings (63, at Strathfield Turgiss, and 60° at some other stations) occurred on the 11th, 12th, or 13th, while the lowest were at the commencement or end of the period. The wind was easterly or south-easterly over the whole country, and though generally light in force blew freshly at times from the south-east on our west and south-west coasts. The rainfall was rather more than the mean in "Ireland, S.," and over Scotland, but less in all the English districts."

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 235.)

- MASDEVALLIA—  
*triaristella*, Rehb. f., 226, 559 (fig.), vi., '76  
*triglocha*, Rehb. f., 643, viii., '77  
*troglydites*, 300, viii., '77  
*Tuberana*, Rehb. f., 234, ix., '78  
*Vitchiana*, Rehb. f., 814, 1338, '68; 1421, '71 (fig.)  
*velifera*, Rehb. f., 406, i., '74; 98, ii., '74; 394, x., '78  
*velutina*, Rehb. f., 1420, iv., '75  
*Vespertilio*, 272, vii., '77  
*xanthodactyla*, Rehb. f., 552, viii., '77
- MASSANGEA—  
*musica*, 268, viii., '77  
*Lindenii*, 440, ix., '78; 306, x., '78
- MASSONIA—  
*odorata*, 1079, '73
- MASSOWIA—  
the genus, 622, x., '78
- MASTACANTHUS—  
*sincensis*, 103, '46
- MATE—  
(see *Hex paraguayensis*)
- MATHIENA—  
*galanthoides*, 23, '54
- MATHIOLA—  
(see *Stock*)  
*maderensis*, 415, '41
- MAXILLARIA—  
*acicularis*, 319, '48  
*acutipetala*, 054, '41  
*caloglossa*, Rehb. f., 654, x., '78  
*ctenostachya*, Rehb. f., 39, '70  
*grandiflora*, 752, x., '78  
*Harrisonia*, 344, '41  
*lepidota*, 168, ix., '78  
*neophylla*, Rehb. f., 588, x., '78  
*porphyrostele*, Rehb. f., 978, '73  
*Reichenheimiana*, 1678, '71  
*speciosa*, Rehb. f., 197, vi., '76  
*triangularis*, 211, '45  
*trilobis*, 1079, '73
- MEDICAGO—  
*echinus*, 1148, '73 (fig.)
- MEDINILLA—  
*amabilis*, Dyer, 373, i., '74 (fig.); 715, ii., '74  
*erythrophylla*, 431, '43  
*magnifica*, 421, ii., '74 (fig.)  
*speciosa*, 671, '47
- MEGACLINIUM—  
*Bufo*, 348, '41 (fig.)  
*melanorrhachis*, Rehb. f., 162, iv., '75  
*purpuratum*, 1079, '73
- MEIRACVLLIUM—  
*gemma*, 983, '69
- MELALEUCA—  
*Wilsoni*, 715, ii., '74
- MELIA—  
*floribunda*, 1079, '73
- MELILOTUS—  
*leucantha* (Bokhara Clover), 383, '42
- MELLOCA—  
(see *Ullucus*)  
*tuberosa*, 685, '47 (fig.); 828, '48 (fig.)
- MELON—  
*Cucumber*, 1335, '73 (fig.)  
*White Cantaloup*, 869, '64  
*hybrid*, 1155, '64 (fig.)  
*sport*, 1135, '61
- MENINIA—  
*turgida*, 715, ii., '74
- MENTZELIA—  
*ornata*, 726, x., '78
- MERENDERA—  
*Aitchisoni*, 1079, '73
- MERYTA—  
*latifolia*, 1079, '73
- MESEMBRYANTHEMUM—  
*abyssinicum*, 715, ii., '74  
*Cooperi*, 300, viii., '77

## Home Correspondence.

**A Feast of Phalænopis.**—At Henham Hall, East Suffolk, the seat of the Earl and Countess of Stralbrooke, there is a choice collection of these lovely Orchids. I took a run over in the first week of March on purpose to see them. It was the richest floral feast I have ever enjoyed. The plants were sent home some years since to the Countess, who is alike distinguished by her taste in landscape art and her keen interest and practical knowledge of all the more choice plants and flowers. It need hardly therefore be added that, since their arrival at Henham, the Phalænopis have had special care. They are grown in baskets suspended from the roof of a small stove in the pleasure-grounds, and the whole roof was covered with their glorious blossoms. There are forty plants in all, about a dozen of them being *P. Schilleriana*, the others being chiefly *amabilis*. Nothing can exceed the healthfulness and beauty of the plants. The foliage is large and fine, and the flower-stems are of immense length and strength. Many of the plants had two flower-stems, a few of them three, and several of the plants carried from seventy to a hundred fully expanded blossoms at the time of my visit. The plants were nicely mixed, and the effects of the different shades of pink with the white was rich and pleasing in the extreme. Many of the flowers were of unusual size, and one or two of *P. Schilleriana* were so vivid in colour as to appear like distinct varieties. Among the whites there were also degrees of whiteness as well as of size, some of the plants having very fine flowers of spotless purity. About a year ago the present gardener at Henham, Mr. Benham, fresh basketed the plants, and the freshness and size of the new leaves as well as the length of the footstalks showed that they liked their fresh baskets and were hard at work to fill and overflow them with roots. There is one rule enforced at Henham which also no doubt tends to preserve the Phalænopis in health and beauty—they are never removed from the house in which they are grown to other rooms or conservatories; hence they have no chills nor sudden changes during their flowering period. Individual flowers are often gathered, but the stems are seldom cut. Thus the plants continue in full beauty from first to last, and at the end of the flowering season the plants are as healthy as at the beginning. Those who grow Phalænopis know that they are not only beautiful but sweet as a Violet, if not sweeter; only practical men, however, are possibly aware how very much sweeter the plants are by night than by day. Having almost lived with the Phalænopis during my brief visit to Henham, I was much struck with their extreme fragrance at night. It is possible that the insects that effect their impregnation are nocturnal ones, and that their extra fragrance may be the natural means of alluring them to the flowers? Be that as it may, healthy as these plants are, they have shown no disposition to seed, nor have offsets hitherto sprung from the flower-stems, though prominent buds appear on many of them. Stems furnished with such buds have been laid, e.g., but hitherto without resulting in young plants. It seems a pity that such magnificent plants should be so slow of increase, as there is nothing within the whole range of horticultural pleasure to equal such a feast of Phalænopis as is annually spread at Henham. *D. T. Fish.*

**Propagating Alternantheras.**—I am sure those of your readers whose duty it is to work up a stock of this plant for bedding purposes will concur in the opinion of Mr. Hinds. I find from experience that the middle of April is quite early enough to commence propagating, provided a sufficient stock be in hand for the supply of cuttings. The best plan I have found, and from which I have always obtained the best plants, is to make up a slight hotbed, upon which I insert the cuttings in a compost of cocoa-nut fibre and sand; in this way I have worked up a splendid stock of plants in a month, which were quite ready for transferring to their summer quarters. I may add that the plants remain in this bed after being rooted, never being potted or boxed; and in this way a great amount of labour is saved and better plants are produced, while the hardening off is rendered more easy and simple. I would also recommend this plan as being far more expeditious for increasing the stock of *Mentha pulegium gibraltarium* than either Mr. Wildsmith's, p. 311, or Mr. Waterman's, p. 319. *E. Morgan, The Butts, Harrow-on-the-Hill.*

**Pampas Grasses.**—Judging from the browned appearance of these there cannot be much life in them, and I greatly fear that the past winter will prove as fatal to them as did those of 1860 and 1861, when large numbers were killed and others so injured that they did not recover, and get strength to reach a good flowering condition for years. Although the frosts have not been so sharp as they were during the period referred to, they appear to have had an

equally damaging effect, owing, no doubt, to the sunless summer and the late growth most things made, together with the soft succulent condition they were in, with sap-vessels gorged to repletion. It is therefore not surprising that the expansive force of the ice should force these asunder, and so cause a general collapse of the plant's structure. This seems to have been the case with the Pampas grasses, but though they look bad now many of them may break up again if not interfered with too soon by clearing away the dry lifeless portions, which if left form such an excellent protection against winds, shielding the young tender growths as they emerge from below. As soon as these can be fairly distinguished it will be quite time enough to remove what is dead. This should be done by pulling it away carefully, with a glove on the hand to prevent the flesh being cut by the serrated edges of the leaves, which are as sharp as knives. In cases where it is desirable to replace any defunct Pampas-grass, I should advise the transplanting to be deferred till May, a season when, if taken up with ordinary care, they may be removed with safety and divided if necessary to almost any extent. The thing to insure success is to well flood them with water so as to wash the earth thoroughly amongst the roots, after which the top part should be filled up with dry soil, and have a forkful or two of manure laid on to prevent any cracking of the crust or loss of moisture through evaporation. *J. S.*

**Chimonanthus fragrans.**—This plant has not flowered well here this season; it has not missed flowering for a number of years, but this winter it had only two flowers on it. It would be interesting to know if it has flowered or not in other places. I should like also to learn how Magnolias have stood the winter; ours are hit hard, and they were covered with Spruce boughs; a Loquat on the same wall (south) looks better than the Magnolias. *James Tickle, Mells Rectory, Frome.*

**New Seedling Begonia.**—On calling at Campsey Ashe Gardens a few days since, I was particularly struck with a fine seedling Begonia of the nitida type. The plant was 4 or more feet high, with beautiful foliage, and a few brilliant bold cymes of flowers about three times the size of the best grown nitida. The colour was also of the most brilliant red. It was altogether so striking and such a useful plant for cutting and for conservatory decoration, that I begged Mr. Sheen, the clever gardener—who is so well known as a Rose, Tree Carnation, and Begonia grower—to take the plant up at once to the Floral Committee. Unfortunately, however, Mr. Sheen had cut all the flowers off but one, and this I advised him to send at once to the Editors of the *Gardeners' Chronicle*. Their opinion last week is most favourable (see "Notices to Correspondents"). In ordinary cases it would be wisest to allow the matter to rest there. But so valuable a plant for general decorative purposes and vase work has not come under my notice for a long time, and I feel that I am rendering a service to all cultivators in urging Mr. Sheen to distribute this very fine Begonia at the earliest opportunity. He proposed, at my suggestion, getting a pure white of a similar character and habit, which would also prove a great acquisition. Mr. Sheen has gone largely into the crossing of the bulbous-rooted Begonia, and has thousands of seedlings, many of which will doubtless prove good; but I venture to prophesy, that among all these none will be found of more permanent value than the one I now bring under notice. *D. T. Fish.* [It would be interesting if Mr. Sheen would state the parentage of this fine novelty. *Eds.*]

**Asparagus Kale.**—Those who have a plot of ground planted with this valuable Kale at the present time may be considered fortunate, as it is one of the few things which has passed through the ordeal of the late severe weather unscathed. I can confidently recommend it as being truly a gardener's friend, and those who do not happen to have grown it hitherto would do well to give it a trial. They will find it exceedingly useful as a first course vegetable for the dining-room, and extremely valuable as a vegetable for the servants' hall. From plants the seed of which was sown in April last we have just commenced to cut, and we shall, I have reason to think, continue to do so till early Cabbages turn in. *J. Horsfield, Heytesbury.* [Why does this excellent vegetable so frequently rot off in autumn? *Eds.*]

**The Liverpool Horticultural Association.**—It is with feelings of pleasure and satisfaction that I send a brief report of the proceedings of the Liverpool Horticultural Association of the past year. It is barely twelve months since a meeting was convened consisting of the leading practical gardeners of the district and others interested in horticultural matters to discuss the propriety of holding a grand show worthy of Liverpool in Sefton Park some time during the past summer. The suggestion

was received with the greatest enthusiasm by all the principal gentlemen of the district, including the then Mayor of Liverpool. Funds were forthcoming from all quarters when it became known that the new movement was to be conducted under disinterested management without being tainted with "trade influence;" indeed, two or three private gardeners (in honour to their efforts) succeeded in obtaining a handsome sum in the shape of subscriptions from local gentlemen in such an incredibly short time as to render it obvious that all that was required was good management and a "sound principle" upon which to float the new horticultural movement. The first show was held in Sefton Park from August 2 to 4 in last year, and the exhibition turned out to be a great horticultural as well as a financial success. Some of the leading exhibitors of plants and fruits from all parts of the country put in an appearance, the result being that the most sanguine expectations of the hard-working committee were more than realised; indeed, to use the words of a member of the new association, it was one of the finest "horticultural feasts" that ever was seen in Lancashire. In addition to the ordinary business of the Society with regard to the arrangement of its exhibitions, &c., a series of monthly meetings have also been established, at which interesting papers on a variety of horticultural subjects are read by members of the Association in turn. This is perhaps the best step that ever was taken to disseminate practical knowledge amongst gardeners, to cement the bonds of friend-ship closer between members, and to unite gardeners as a whole into something like an organisation which shall have the power and the will to adjust and administer its own affairs in an equitable and proper manner. The wind-up of the financial year is of the most satisfactory character. From figures before me it appears the Association has enough at its bankers to clear all expenses of another show this season, and that a second show is contemplated if the subscriptions are anything equal to last year. I am sure this short report, so promising in every respect, will be received joyfully by all connected with horticulture, when so many people would have us believe that these gatherings are growing unpopular. Let such marked success at Liverpool stimulate and infuse fresh vigour into other societies, and if need be let them dissolve and purge themselves of all elements that are not tending to promote our common cause. It is to be hoped that the committee of this prosperous Association will be furnished with adequate funds to hold a grand Chrysanthemum and fruit show in the autumn, and that classes for vegetables will also be included in the schedule. A real exhibition of this kind without ostrich feathers and grasses would put fresh life into horticulture in so flourishing a neighbourhood for the next seven years, and enhance the art of gardening in the eyes of those who look upon a garden more as a necessity than a pleasure. *Exhibitor.*

**Senecio pulcher.**—There is something not quite satisfactory about the behaviour of this plant. As the *Gardeners' Chronicle* said last autumn, the roots are proof against cold or mismanagement, and I find that it can be propagated to any extent, as stated, from fragments of root an inch long; but it seems as if it ought to be evergreen, and in cold wet soils the leaves are killed in winter, and in that case the crown of the plant perishes also, and the new growths from underground are not strong enough to make flowering heads the same year. I suspect that for such soils a stock will have to be kept in cold frames, to be planted out in spring; but perhaps others will tell us their experience of it. *C. W. Dod.*

**Art in the Conservatory.**—I can but hope that practical results will follow from the discussion on this subject, wherein, if success is to be at all likely, simplicity and good proportion of outline must be the governing characteristic rather than an endeavour after quaintness and elaboration of detail. There is one point recommended by Mr. Fish in your last week's article to which I think some objection may be raised. I refer to his advice about the rain-water collected on conservatories being allowed to go into the waste drains rather than being collected, as he advises, in tanks at low or high levels. No doubt endless advantages, and, indeed, artistic effects, could be readily secured by the means of raised tanks, such as waterfalls, and the like arrangements, but in conservatories, where putty glazing is used, the water collected from the roof is always more or less rendered impure by the decomposition of the paint and putty, which in time so impregnates the water as to cover the foliage of plants over which such water is used with a thin film, giving them a dull and deadened look. I have no less an authority to bear me out in this than Mr. Smith, the well-known ex-Curator of the Royal gardens at Kew. This objection leads me to suggest that the old systems based upon putty glazing should be avoided, and a more extended use should be made of those arrangements without putty, such as Helliwell's patent, which practically is an

admirable method, although, as I said in my lecture, I do not quite see how, from an artistic point of view, the want of apparent constructional lines in houses glazed in this way can be overcome. I am, however, intending at an early date to take up this matter again, and endeavour to show how the difficulty pointed out may be overcome, and I feel sure that for all roof glazing putty will soon be superseded by some one or other of the mechanical methods of fixing the glass now before the public. *Maurice B. Adams, A.R.I.B.A., Kirkcote, Chiswick, W., March 17.*

**Hardy Palms.**—It may interest the readers of the *Gardeners' Chronicle* to know that the two fine Palms, *Chamærops Fortunei*, growing in the pleasure grounds here, have again passed through the winter without any injury, and more than that, new leaves are already pushing through the mass of natural protection—the hairy fibres on the trunks—which the plants seem to develop in greater profusion than do the same kinds of plants growing indoors. The soil in which they are growing is a sandy loam, on a gravelly bottom, and the position is well sheltered from the north and east. The only artificial protection they have ever had was a few hay bands twisted round the stems, and these were not put on till the last severe frost set in, on January 15. Our lowest registered temperature—8°, or 24' of frost—occurred on December 11, and at that time the plants were not protected. From the 20th to the 30th January the mercury never rose higher than 28°, and each night it receded as low as 10° and 12°—a severe trial surely to any but the hardiest plants, as is proved by the destruction of some reputedly hardy kinds. *Euonymus* are all of them much injured, *E. elegantissimus variegatus* is quite killed, and so is *Berberis Darwinii*, *Arbutus Unedo*, *Cyrtomeria elegans*, and *Ceanothus azureus*: these constitute the whole of the deaths, but several other kinds are more or less injured, amongst them are Sweet Bays and common Laurels, *Laurustinus*, *Magnolia grandiflora* on a south wall. *Pinus insignis* and *Abies lasiocarpa* are the only Conifers that are injured; the Japanese varieties, usually thought to be tender, are in no wise hurt. *W. Wildsmith, Heckfield, Hants.*

**The Gooseberry Caterpillar.**—As the season now approaches when our Gooseberry bushes are attacked by the caterpillar, I beg to say we have been freed from those terrible pests by using the following mixture, viz., three parts of powdered quicklime to one of guano, thoroughly mixed, and applied early in the morning in the centre of the bush where the branches start from. We use about a teacupful to each, which falls down the stem and dresses the roots. The mixture should be applied on a quiet day; it not only destroys the caterpillar, but nourishes the bush. *B. H. V., Hersham, March 11.*

—Having had a taste for horticulture and agriculture in my early days, and consequently being a reader of periodicals devoted to the subjects, it was my practice to enter in a copy-book devoted to the purpose communications which I met with of a useful and practical character, from reliable authorities. On looking into this book recently, at an early date, for another purpose, I dropped by chance on "The Gooseberry Grub." I send you a copy of this (which I have no doubt came from a high authority, though I carelessly omitted to write the name of the author), at this season, bearing in mind the grievous complaints of the devastation of these grubs on the Gooseberry and Currant trees during the last season. *Charles Lawrence.*

"The fly, the source of the grub, has four wings; the antennæ black, the throat yellow, with a large black spot above and below, the body a clear unspotted yellow, the legs yellow, and the feet black; the wings, when extended, cover five-eighths of an inch, and the length of the body is three-eighths of an inch. As soon as the female leaves the nest she gets on the under side of the leaves, and, standing direct over the mid-rib, her back downwards, her wings closely folded, her antennæ stretched straight out, she deposits her first egg on the rib itself, then a succession up to the top of that rib, then to one of the side ribs, then to another, until all the principal ribs are garnished with her eggs ranged in rows. After the first day the eggs begin to grow, and at the end of a week they become three times the original size. It is seldom more than a week before the grub leaves the egg—from four to twelve days. The grub comes down at once from the egg, and begins feeding on the fleshy part of the leaf. The grubs descend in equal numbers right and left, leaving the skins of the eggs attached to the ribs. The searching for and picking off the leaves studded with these eggs is the exact time to save the fruit. If this opportunity be lost the next chance is picking the grubs by children off the leaves into a basket, to be burned. After two months the grub discontinues eating, and either descends down the stem of the tree, or drops from the end of the branch on which it has been feeding to the earth. In this it burrows from 2 to 8 inches according to the lightness or firmness of the soil, where, during the winter, it undergoes some change, and ultimately emerges in a fly in the month of April or beginning of May. From eggs laid the beginning of May the insect will sometimes go through its changes by July 10, or the 15th at latest, the

first brood taking about twenty-eight days, the second remaining underground till the following spring. The pickings suggested having been imperfect the next most efficient remedy is to tread or beat the earth immediately round the stem, and to the extent of the branches, as firm as possible, which will prevent the grubs still above ground from burrowing into it, and those which may have entered from getting out of it again."

**Chanthus Dampieri.**—This grand plant is not grown so much as its merits deserve. Grown as a climber in a cool house it is charming with its silvery foliage and drooping racemes of vivid scarlet blooms, which last in perfection for a long time. It is usually considered somewhat difficult to manage, but this is by no means the case, if the plant is provided with proper drainage, and receives a good supply of water, coupled with ordinary attention. I am informed that it succeeds very well as an outdoor climber in the Isle of Wight: perhaps some of your readers can inform me if that statement is correct. *T. A. S., Buxted Park.*

**Meconopsis nepalensis.**—We have heard much of the hardness of this plant, but I have seen no directions given for raising it from seed, and I am sure the gardening public would be thankful for information on the subject, as it is now generally believed that both it and its near relation, *M. Wallichii*, are biennial, and die after flowering. If any one has succeeded in flowering a plant of either twice, I will offer a humble apology to all those nursery gardeners who advertise them as hardy perennials. *C. W. Dod.*

**Trug Baskets or Bodes** (fig. 68).—These are the most useful garden baskets I have ever met with, and are much used in some parts of the country, but quite unknown in others. They are very handy for removing soil, collecting Potatoes, transplanting, gathering Peas, Beans, &c., and are not easily surpassed for flower gathering purposes; they are, in short,

FIG. 68.—TRUG BASKET.

useful for all kinds of work which usually falls to the lot of a gardener. They are made of thin strips of willow nailed to a cross-handle and rims of ash, nearly in the shape of a boat, and are furnished with two feet to keep them steady, and are very light, durable, and handy to use. The coopers make them in some parts of the country, but any one who finds any difficulty in obtaining them would do well to communicate with Messrs. Dick Radcliffe & Co., 192, High Holborn, who supply them at a moderate price according to size, &c. *W. H. Divers, Burghley.* [We know them as "Sussex trucks." Eds.]

**The Uprooting of Conifers.**—I should like to supplement my letter of advice on this subject at p. 181, by giving a little more of my experience on the weighting of tree roots to prevent the tree toppling over by the force of the wind. This subject has been taken up by several correspondents; all of whom have more or less wandered from the subject at issue, and landed on the well known practice of surface dressing of trees. We may take it for granted that gardeners generally know that all trees are benefited more or less by top-dressing, from the small fruit upwards. Mr. Kestley maintains that the roots of trees will bear weighting up considerably without injury. He points out that trees so earthed up are very much benefited, especially in hot dry summers. He ought to be an authority on the subject, for in the relaying out of the gardens at Newton House near here he had plenty of practice in manipulating the roots of trees in every kind of way. For my own part, I would not earth up the stem of a tree at all if it could be avoided, although I have not experienced any ill effects from doing so. Another correspondent advises bricks to be placed round the stem of the tree. This I think would so attract the worms that they would soon form the soil into a consistence almost equal to putty, which would prevent the air reaching the roots, if air they must have from that source. I have seen so many trees earthed up with advantage, that I cannot think a tree would die by having its roots deeply covered up on one side as a correspondent states. If a tree were earthed up in a wet situation the site should by all means be well drained, or the health of the tree would no doubt be affected. Mr. Fish states the principal weight on the

roots is required about 6 feet from the stem: this coincides with my own views, except in the case of large trees, when the weight should be considerably extended. Mr. Fish also thinks that coniferous trees would suffer more than deciduous trees from earthing up. I do not understand why this should be so, as the sap action must be more rapid in the evergreen, especially on sunny days when evaporation is going on in the leaves. A considerable weight of soil might be placed on the roots of trees without a visible increase in the height round the stem. The *Abies nobilis* that I alluded to in my first communication had twelve cartloads of soil placed on the roots, which raised the soil up the stem 12 or 15 inches. This would be equal to about eight tons. The soil has sunk considerably in eight years, but the effect on the growth of the tree was marvellous. I should add that a deep drain was cut partly round this tree when the soil was put on. I may mention two *Wellingtonias* that were considerably earthed up on levelling a piece of ground a few years since: they are making the best growth of any at this place. We have also earthed up *Abies Pinsapo* and *Cedrus Deodara*, the only tree out of several of that sort left alive after the severe winter of 1890 and 1861, when the thermometer fell to 13' below zero. Various other trees are doing well so earthed up: the most notable are two brave old Oaks, with stems 18 feet in circumference; one of those trees had a mound placed round it before my time, the other I earthed up about thirty years since, having to raise a bank on the edge of one of the lakes here. Another instance: when a lake joining the garden was enlarged, more than thirty years ago, a considerable quantity of the soil was wheeled into a clump of Spruce Firs, as an easy way of getting rid of it, and some of the stems were earthed up more than 2 feet: those trees are still healthy and doing well. If I had a choice I would always weight the roots by degrees, as it would always act as a top-dressing as well. In the case of a large *Abies Douglasii* which looked rather unsafe in the late severe gales, I had the roots weighted only last week with four cartloads of soil, nearly equal to four tons, and next spring I shall give it an equal quantity. *William Culverwell, Thorpe Perrow.*

**Planting Evergreens.**—Those who have deferred the transplanting of these will be fortunate, the winter having been such that had they been moved in the autumn the probability is that the greater part would have perished, for even those well established have suffered to a considerable extent, and March is not yet out, till which time the full effect the weather has had cannot be seen, though it is greatly to be feared the mischief done will then be only too manifest in brown withered leaves and shrunken bark, the final result of the severe season we have just passed through. No doubt the summer had much to do with the present unsatisfactory condition of evergreens, as owing to the heavy rainfall and absence of sun till the autumn set in they were encouraged to grow later, and the shoots they made under such circumstances could not be other than full of sap, consequently very soft and immature, which rendered them exceedingly tender and readily susceptible of injury from frost, as may be seen by an examination of the bark, the inner portions of which I find are much discoloured, and which will therefore most likely decay later on. In ordinary seasons plants of this class may be shifted with a tolerable amount of success if taken in hand during September and October, but their removal then is always attended with more risk, owing to the great uncertainty of how the winter months may turn out, even should they be mild and favourable it often occurs that March with its cutting blasts searches them to the core and dries all the vitality out of them. Evergreens will stand much cold in still weather, after being planted, but expose them to the fury of raking winds and see what pitiable objects they look with drooping foliage, shivering as it were and calling for commiseration from every passer-by. There will be plenty in this state at the present time, and many gaps and losses to be made good; and as April is the most favourable season of the whole year for carrying out such work, the sooner preparations are commenced for doing it the better. It is very important in all transplanting operations that the trees or shrubs be got in with as little delay as possible, for if the roots are exposed or remain long out, the fine fibry spongioles perish, and it takes some considerable time before others are formed. It is therefore a good plan to dig all the holes that may be necessary at first starting, in doing which plenty of room should be allowed, and the ground well broken in depth, so as to enable the roots to extend in that direction as well as laterally, and although such digging involves more labour it pays in the end, by the increase of growth in the plants and the enhanced appearance it gives in contributing so much to their health. In planting Conifers and such like on lawns their effect may be considerably heightened by choosing the most elevated positions for them, as nothing looks worse than to see a tree so situated as to have its base below

the general level, with the ground inclining to it instead of rolling away in bold sweeps. Mounds like gigantic molehills are to be avoided, as their contour is objectionable, and from the sharp declivity they offer rain is thrown off and prevented from reaching the roots. These, when covered partly with soil, should have it well washed in amongst them by using water in quantity with some force by throwing it on in large volumes, in which way it carries the fine particles of earth with it into all crevices that, without its aid, would remain unfilled. After standing a few hours to settle, the rest of the earth can be thrown in and made level, and then mulched over, to prevent any escape of moisture by evaporation—which is an important matter, as the more uniform the soil is kept the greater are the chances of success. Another thing of equal consideration is the steadying of the tree, for if allowed to sway to and fro it is impossible that the roots can take fresh hold, the movement being such as to cause continual straining and friction, but with a rigid top they emit new feeders at once. For choice trees, such as Conifers, in conspicuous places, the nearest and least objectionable stays are those which may be made by using strong galvanised wire in three pieces, running them out to stout stakes placed triangularly in the ground, at a good distance from the plant to be supported, round the stem of which a collar of some kind should be put [old innlarubber hose is a good material] and the inside stuffed with hay or a piece of mat, as a padding, to keep it from chafing the bark, and to this collar the wires may then be made fast. Long stakes or poles used much in a similar way answer the purpose equally well, or perhaps better, where neatness has not to be thought of. Big Laurels and suchlike are more manageable if they have their heads considerably reduced before removal, by doing which even those of great age and size may be transplanted with safety, and when they break again they furnish up quickly and soon form handsome specimens. J. S.

**Trachelospermum (Rhynchospermum) jasminoides.**—This is a most useful plant for button-hole work, or grown as a specimen for conservatory decoration. It is very little trouble, and providing it be kept clear of the mealy-bug and scale it will keep growing and flowering for a considerable time. A greenhouse temperature will do for it during the summer, and also till it is wanted for forcing. It may be put out-of-doors during July, stood on ashes with other plants, such as Azaleas, &c.; but I find keeping it in the house best, as its flower-buds plump up stronger. The plants should be kept somewhat drier during the three latter months of the year. Remove it to the forcing-house or pit in January, plunge the plant or plants in a bottom-heat of 75° to 80°, giving the plants at the time of starting them a good soaking of warm water at about 60°, and syringe them every day and on every favourable occasion. If plunged in pits take great care that the heating material does not rise above 85°; should it do so remove a little of the dung with your hand away from the sides of the pots, which will allow the heat to escape without removing the plants; keep a little air on the back of the pits day and night—about the thickness of a penny piece at night. When the flower-buds show signs of opening, raise the plant by degrees about half out of the heating material and reduce the top-heat, and in a few days it may be removed to a cooler house, where cold draughts must be avoided or the young foliage that it has made so quickly will drop off. By the middle of February, if all goes well, you will have a mass of white sweet-scented flowers, and where buttonholes are in daily demand there is nothing much nicer and neater when mixed with a little Bouvardia and Fern. Should the plants be old ones, and not have been repotted for a year or two, Clay's Fertiliser will greatly assist them, or sheep manure-water applied warm, at about 80°, about twice a week. It strikes easily in the spring from cuttings, in three parts of good loam, one part good rotten manure, with a little leaf-mould and sand; shift the plants as they fill the pots with roots, and keep them plunged in bottom-heat, if there is room. The cool end of a stove will suit them, and the shoots should be kept tied down as they grow, not forgetting to keep the syringe at them twice a day, which will keep the young shoots free of insects. Some good-sized plants will thus be obtained by the autumn, and they will repay all the trouble the next spring by a nice lot of flowers. H. W. H.

**Sowing Onions and Carrots on Clayey Soil.**—Having been successful with crops of these on a tenacious, cold soil, which is especially unfavourable to the well-doing of the Carrot, and on which if managed in the usual way it is difficult to catch a good season for sowing, I venture to give you our mode of procedure. Seed sowing is a most important point in the cultivation of all vegetables, for when indifferently carried out it not infrequently results in the partial, if not total failure of the crop; it also sometimes causes undue complaints respecting the

quality of the seeds. I have known one grower succeed while his neighbour failed, where the only difference in their management was that the successful one took the precaution to cover his seeds with light soil, which the other neglected to do. To some this may appear a trivial matter, nevertheless it deserves attention, for it is essential to the production of good crops on cold adhesive soil. In preparing for Onions and Carrots we select in autumn a plot that has had Peas as a preceding crop, and for which it has been heavily manured and double dug the previous autumn. I may here mention that in double digging we do not bring the bottom spit to the surface. The portion for Carrots receives no extra manure, but that allotted for Onions is again liberally dressed with short dung, derived from yards where hunters have run and been fed on corn and hay during the summer. When this is done the whole plot is again double dug, and as the digging proceeds the dung is thoroughly mixed with the top spit, and the soil is well broken, not ridged but left level on the surface; it has no further attention until it is frozen sufficiently hard to bear a man's weight, then as a check to slugs it receives a sprinkling of gas lime, and is again left to the action of the weather until sowing time arrives. About the second week in March we generally catch a favourable opportunity to sow the Onion seed: in the first place the ground is driven with rakes, and cleared of large stones, a shallow drill is then drawn in which the seeds are thinly and regularly distributed, and covered with previously prepared dry light soil, in which wood ashes have been mixed; the young plants easily push through this; it also stimulates, and is of material assistance to the crop. The surface of the drill is then made firm and even, and the ground levelled for the next drill; in this way drill after drill is sown, a foot apart, until all are finished. Early in April we put in James' Intermediate Scarlet as the main crop of Carrots; this is preceded with in much the same manner as with Onions, the only difference being that the drills are drawn deeper, to admit a good layer of wood-ashes on which the seeds are sown. Since this plan has been adopted there has not been a failure or any annoyance from wireworm in ground where it previously invariably destroyed the crop. Perhaps nothing gives a kitchen gardener more satisfaction than a superior crop of Onions. This we have been fortunate enough to secure each season, with the exception of one, since we practised the above mode of culture. The partial failure was caused by a severe frost which happened just after the young plants were aboveground, which it paralysed and crippled to such an extent that they never thoroughly recovered. At no time previous or since have I known young Onions injured by frost in spring, and I have seen them sown as early as the middle of February several years in succession as far north as Aberdeenshire. After trying several sorts we have fallen back on two good old kinds—Deptford and Brown Globe. These are hardy good keepers, and suit our purpose for spring sowing. *Thos. Coomber, Hendre Gardens.*

**White Scale on Pines.**—If Mr. Clark will try the following, he will, I think, have little difficulty in getting rid of this troublesome insect. Dissolve 16 oz. of Gishurst Compound in a gallon of soft water, immerse the plants, and let them remain in the liquid for three minutes; then take them out, turn them bottom upwards to drain, and do not wash or syringe after dipping. When the plants are dry plant them in a bottom-heat of 90°, and keep up a good moist temperature in the house; shade them from the sun until they begin to make growth, after which treat them in the ordinary way. Of course, the houses or pits in which the plants have been growing will require a thorough cleansing before making use of them for Pines again—scrubbing the walls and woodwork thoroughly, for which purpose Gishurst Compound may be used of the same strength as that in which the Pines have been dipped, or as much stronger as Mr. Clark may deem necessary; seeing there is nothing to injure or kill but the scale, the stronger it is used perhaps the better. I am certain of the efficacy of this recipe. Some years ago I had some suckers from a friend of a variety I wished to grow, not having the least idea that he had scale in his stock. I planted them with mine and grew them on; not many months, however, elapsed before I found, to my great annoyance, a goodly crop of scale. I could do nothing in the way of clearing the plants then, so fruited them, and selected the suckers and treated them as above recommended. Since that time I have never had a scale on my stock of Pines. *Nemo.*

**Weather in the North of Scotland.**—The weather here ever since the break up of the storm in the early part of December last has been with little exception so remarkably fine, and has formed such a decided contrast to that in the southern part of the kingdom and many other places on the Continent, that I have considered a statement of the temperature at this place during the two past months might prove of

interest to some of the readers of the *Gardeners' Chronicle*, more especially those who are unacquainted with a northern climate. It is the belief of many people who do not make a study of the causes which influence climate, or have not otherwise made themselves conversant with it by reading of their results, that the farther we go north the colder the atmosphere becomes. That this theory is not borne out by the facts we have only to look to the average temperature of the winter season in the Western Hebrides and northern part of Scotland, where Fuchsias and Hydrangeas live unscathed by frost, and grow up to large bushes, while in the Island of Faeroe, 500 miles further north, the winter temperature averages about 2 higher than that of London. There is little doubt but this results from the influence of the Gulf Stream washing our northern shores, and the narrowness or smallness of the area of land; It is worthy of remark that the severest night's frost of the previous winter was on December 13, and was exactly the same as that of December 2 and 3 last. The former winter was a long and protracted one, but scarcely anything suffered with us from its severity, and very little appears to be injured by the last frost, although wood was badly ripened. Laurustinus is now flowering, and Apricots upon the open wall have now (February 20) some flowers fully expanded. The following is a statement of temperature for the months of December, 1879, and January, 1880, from a tested thermometer, sent out by the Scottish Meteorological Society—reading taken by myself:—

J. Webster, Gordon Castle Gardens, Feb. 20.

**Minorca Plants.**—I am glad to see Cyclamen balanicum and Hyacinthus Pouzolizii coming up both in a glazed pit and the cold frame. Crocus Cambessedii, too, has weathered the storm in the open border. *H. Harpur-Crewe, Drayton-Beauchamp Rectory, Tring, March 4.*

**Rhododendron barbatum.**—I herewith forward you three trusses of bloom of Rhododendron barbatum, cut from plants growing out-of-doors and which never get any protection. We have about fifty plants of this species growing in different parts of the grounds here, and at the present time many of them are masses of flower. Our largest plant measures 15 feet high and about 12 feet through, and I counted this morning 140 fully expanded trusses upon it—a sight that is worth a journey from London to see. R. barbatum is the earliest Rhododendron we have, being just a fortnight earlier than either variety of R. Nobleanum, and the flowers being of good substance stand the weather well, as will be seen by the specimens sent, which have been out in all the hurricanes of wind and rain, and sometimes hail, we have been experiencing this last fortnight. *J. Harris, The Gardens, Singleton, Swansea.*

**The Scarcity of Pear and Apricot Blossom.**—This it is to be hoped will prove about the last lean legacy of the year 1879. There is, I fear, no question but that the scarcity is general. In a recent run over a considerable district in East Anglia the scarcity of bloom seemed general. Of course there are exceptional trees here and there—we have several; but on the whole I never remember to have seen so thin a sprinkling of Pear and Apricot bloom. We have few of the latter left, and those few are

almost without blossom-buds. Where trees have escaped injury, as at Henham Hall, where the Peaches were killed and the Apricots scarcely injured, thus entirely reversing our experience, the trees promised a fair bloom; but so also did our wrecks of trees, but the promise has faded into bloomlessness—the immature fruit-buds have fallen off before opening. The Pears never showed any bloom-buds. Some attribute this to the heavy crop of last year. There may be something in this, as one of the peculiarities of last season, so erratic in its effect, was plenty of Pears and few or no Apples. True, many of our Pears never ripened. The lateness, however, had probably more to do with the non-development of fruit-buds than the heaviness of the crop, for the fruit and the wood, as a rule, ripen abreast, and hence green fruit in October means also immature wood. The fact, arise how it may, is most discouraging, and will cause a serious blank in our fruit supply this year. *D. T. Fish.*

**Primula Sieboldii** (*cortusoides amœna*).—In the spring of 1879 I planted out this species on a shady rockery facing north-east. It has had no protection, but is coming up much more strongly than those plants which have been wintered in pots in the frames. *H. Harpur-Creese, Drayton-Beauchamp Rectory, Tring.*

Reports of Societies.

**Scottish Horticultural Association: March 2.**—The annual general meeting of this Association was held in 5, St. Andrew's Square, Edinburgh. About 130 members were present, and the President, Mr. M. Dunn, Dalkeith Park Gardens, occupied the chair. After the admission of several new members, a motion to increase the number of Vice-Presidents to five was carried. The Secretary, Mr. Alexander Milne, then read the third annual report of the Association's operations:—

*Report of Session 1879-80.*—The Council of the Scottish Horticultural Association, in presenting the third annual report, have much pleasure in stating that the progress made during the first year has been more than could have been anticipated at last annual meeting, 117 new members having been added to the roll, this being an increase of six over the previous year. The total membership now numbers 499.

Since the institution of the Association, on March 20, 1877, monthly meetings have been regularly held on the first Tuesday of each month in the hall, 5, St. Andrew's Square, and Council meetings have also been convened from time to time. The attendance at the ordinary meetings increases monthly, and now varies from 85 to 120, and at Council meetings members have been generally nearly all present. Eight meetings of the adjudicating committees have been held, granting twelve certificates of the Royal Caledonian Horticultural Society for new fruits, flowers, and vegetables, on the recommendation of the various committees. This increase in the work of the adjudicating department shows that members are steadily taking advantage of these committees for testing new productions. Cultural Certificates are now being issued by the Council for meritorious productions, and during the last three months the exhibits of three members have been deemed worthy of this mark of honour.

The number of papers and communications read on horticultural subjects during the session amounted to thirty-two, being eight more than the previous session. Discussions which elicited useful and valuable information followed the reading of all the papers. There is to note this year a large increase in the number of exhibits, there being as many as eighty-four different collections of plants, fruits, and vegetables tabled at the twelve monthly meetings; in several instances the collections of plants contained over twenty kinds. These exhibits have been contributed by forty-two members, many of them coming from a long distance and sent by members greatly interested in the advance of horticulture.

The Council take this opportunity of thanking members for having so kindly forwarded papers and exhibits. It is also satisfactory to state that six under-gardeners, members of the Association, entered herbaria for the prizes offered in this competition.

An abstract of the several papers and also a list of exhibits will be found in the printed report. The Council are happy to state that not a few of the papers read at the various meetings have found their way into the leading gardening periodicals, and that one paper was printed in full in pamphlet form by the Association.

The Council are aware of a desire in the Association to have a Journal of their own, and also to have a reading-room and library accessible to members, and although arrangements are not yet matured to carry out these objects, they trust that these desirable adjuncts may yet be accomplished at a date not far distant.

While the Council are happy to have to report on the Association's continued prosperity, they have also to regret to have to put on record the death of the following members:—Peter S. Robertson, Trinity Nursery, Edinburgh; Thomas Kettle, Archerfield Gardens, East Lothian, who were also members of the adjudicating committees; and John Caie, Inverary Castle Gardens, Argyll; Archibald Miller, Inverleith Nursery, Edinburgh; James Bryson, Abercorn Nursery, Edinburgh; and John Hoggan, 31, Lothian Road, Edinburgh.

On the motion of Mr. A. McLeod, Superintendent

of the Edinburgh Public Gardens, seconded by Mr. W. M. Welsh, nurseryman, the report was adopted. The Chairman moved, and Mr. A. D. Makenzie seconded, the voting of an honorarium of £10 to 10s. to the Secretary for his past services to the Association, which was agreed to by acclamation. Mr. D. P. Laird, Treasurer, reported that the income for the year, including a balance from the previous account of £21 7s. 1d., had been £61 4s. 6d., and the expenditure £38 15s. 11d., leaving a balance at the credit of the Association of £22 8s. 7d. The report was approved of on the motion of Mr. A. D. Makenzie, seconded by Mr. Hugh Fraser.

The President afterwards delivered a valedictory address, in the course of which he congratulated the members upon the success that had hitherto attended the Association, and pointed out the benefits which might be derived from it by young gardeners, upon whom he also impressed the importance of studying botany, chemistry, and geology. He also referred to the many able papers which had been read during the year, attaching considerable value to the proper selections of the kinds of vegetables, plants, and fruit to grow. To the practical man this department of knowledge could not be over-estimated. The life-history of a plant was a subject in these days becoming of great practical utility to the horticulturist.

On the conclusion of his address, the best thanks of the meeting were awarded to him for his great services to the Association.

The election of office-bearers was next proceeded with. W. H. Maxwell, Esq., of Munches, was re-elected Honorary President; Mr. Malcolm Dunn, Dalkeith Park Gardens, was re-elected President; Mr. Hugh Fraser, Leith Walk Nursery, was re-elected Vice-President. The following were also elected Vice-Presidents:—Messrs. A. McLeod, John Suller, John Downie, and Robertson Munro. Mr. Alexander Milne and David P. Laird were re-elected Secretary and Treasurer respectively. After a vote the following were elected to fill six vacancies on the Council:—Messrs. David W. Thomson, Matthew Todd, W. W. Johnstone, George Simpson, George Goodall, and John McKinnon.

It was announced that the successful competitors for the prizes offered for the herbaria were George Oliver, Royal Botanic Gardens; John Craig, Kew Gardens; and W. H. Divers, Burghley Park, in the order named. The judges were Messrs Robertson Munro, Hugh Fraser, and John Suller. The following exhibits were placed on the table:—A box of cut Roses and flowers of *Cattleya Symei* and *Odonoglossum cordatum*, of great beauty and interest, from Dr. Paterson, Bridge of Allan; two *Tropæolums* in flowers, named Mrs. Shand, from Mr. Andrew Hunter, Newhailes; an antipodal Hyacinth growing in water, with head downwards, by Mr. Robert Laird, Jun., 17, Frederick Street; *Polyanthus* and an Orchid bloom, from Mr. D. Henderson, Gracemount; a collection of cut *Camellia* blooms from Messrs. Thomas Methven & Sons; a collection of *Rhododendron* trusses and *Pyrus japonica* and *Garrya elliptica* flowers from Mr. George McKinlay, Tulloch Castle Gardens.

**Edinburgh Botanical: March 11.**—The Society met at 5, St. Andrew's Square, the President, Mr. William Gorrie, of Kait Lodge, in the chair. Before the usual routine business commenced the proceedings were diversified by the presentation by the President of a testimonial subscribed by a large proportion of the members, and presented in the name of the Society to Mr. Suller in appreciation of his long service of Assistant-Secretary, from which office he has just retired.

The following papers were read:—

I. "On the British American *Violaceæ*," by Professor George Lawson, of Halifax, N.S. (See p. 364).

II. A gift of twenty-one microscopic slides illustrative of the growth of the fungus *Saprolegnia ferax* on salmon and other river fish, and held by Mr. Stirling of the Anatomical Museum to be the cause of the recent salmon epidemics, was presented by him to the Museum of the Royal Botanic Garden. At the same time large jar specimens of fish affected by this fungus in an unmistakable way, even by the naked eye, were exhibited. The various specimens had been taken from the Tweed, from the Eden 12 miles above Carlisle, and from Ightham Moat in Kent, in localities thoroughly isolated from the sources of ordinary river pollution. The further consideration of Mr. Stirling's paper was deferred till the May meeting.

III. Mr. A. Brotherton, of Kelso, made a communication "On the Pasturage of Western Teviotdale in Connection with the 'Lomping-ill' of Sheep." At the request of the local Farmers' Club the author made a botanical examination of the pasturage of a number of sheep farms in this high-lying district. On a spring visit he could not trace any poisonous plants to which to attribute this disease. On the other hand, when making another botanical inspection in autumn he found ergot very abundant. He detailed in the communication no fewer than twenty-three species of grasses which were ergotised. The *Juncaceæ* and *Cyperaceæ*, which form a great proportion of this hill pasturage, were free from ergot, *Claviceps purpurea*; but some of the *Cyperaceæ* were very subject to smut. Mr. Brotherton suggested the eating of ergotised grasses as a probable

cause of the disease, which in this district is a spring one. He emphasised the following in this connection: No different species of plants characterise the isolated localities infected with the disease, but much ergotised grass was found there; the toxicological effects of ergot were similar to those physiological ones characteristic of the disease. In Teviotdale spring is the only time when sheep may perchance eat ergot in quantity. To cut the pastures bare appeared to be the most feasible remedy for this disease.

Miscellaneous Communications.—Dr. Wm. Craig exhibited a specimen of *Betrychium Lunaria*, taken the previous week from a hill in the upper ward of Lanarkshire, 600 feet above the sea level. Mr. Sadler read a note from Mr. John Campbell, Leidaig, Oban, noticing the remarkable progress of spring vegetation. The storm of December 23 had done more damage to half-hardy shrubs, such as Myrtles, *Veronica Andersoni*, *Aster argophyllus* than all the winter's frosts. Mr. Peach read part of a private letter from Unst, Shetland, in which it was stated that on February 24 Crocuses, Snowdrops, and *Polyanthus* were in bloom, and that the Rose bushes were unfolding their leaves in the gardens. Mr. Buchan remarked that such summer-like weather had prevailed as far north as Iceland throughout this winter.

On the table were exhibited in bloom *Saxifraga Stracheyi*, a hardy plant, and *Soldanella montana*, a large seedling hardy form, from the forcing department of the Royal Botanic Garden. A fine stove plant from the same establishment, of a white texture and a pleasant perfume, *Posoqueria multiflora*, also excited much attention. Sir Robert Christison had presented, in illustration of a previous paper, a prismatic section from the diameter of a Yew 237 years old from Inch Lonag, Loch Lomond. Lord Strathmore also sent a section at 2 feet 6 inches from the roots of a Larch blown down at Glanns Castle in the Tay Bridge storm on December 23, 1879. The tree was 109 feet high. Its trunk measured 12 feet 5 inches in girth at 5 feet above roots. This section measured 12 feet 10 inches over bark, and 12 feet 4 inches round the wood. It shows 107 annual rings of wood, indicating 110 to 112 years for the age of the tree.

A section taken 3 feet from the roots, of *Arenga saccharifera*, cut down in the Palm-house of the Royal Botanic Garden when 90 feet in height. Owing to the quantity of starchy matters and other vegetable juices in the stem of this Palm, such a section is very difficult to make, this being the only successful one of many attempted.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 17, 1880.

March 11.—A fine bright day. Cloudy at times. Overcast at night.  
 12.—Dull early part of day, fine and bright afterwards. Overcast at night.  
 13.—A very fine clear day. Cold in morning, quite warm and summery in afternoon. Cloudless at night.  
 14.—A dull day, but fine and quiet. Rather cold. Little mist in morning.  
 15.—Dull and cloudy till 3 P.M., very fine and bright afterwards. Cool.  
 16.—A dull, overcast, odd morning, fine rest of day. Overcast at midnight.  
 17.—A very fine bright day. Sky clear throughout. Cloudless at night, but very cold.

LONDON: *Barometer.*—During the week ending Saturday, March 13, in the vicinity of London the reading of the barometer at the level of the sea increased from 30.08 inches at the beginning of the week to 30.50 inches by the morning of the 8th, decreased to 30.16 inches by the morning of the 10th, increased to 30.44 inches by the evening of the 11th, decreased to 30.30 inches by the afternoon of the 13th, and was 30.32 inches at the end of the week. The mean reading for the week at sea level

was 32.32 inches, being 0.60 inch above that of the preceding week, and 0.21 inch above the average.

Temperature.—The highest temperatures of the air observed by day varied from 60½° on the 9th to 49° on the 8th; the mean value for the week was 55½°.

The lowest temperatures of the air observed by night varied from 33° on the 11th to 44° on the 7th; the mean value for the week was 38½°.

The mean daily range of temperature in the week was 17°, the greatest range in the day being 22½°, on the 9th, and the least 8°, on the 7th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—March 7, 48°, + 7°.5; 8th, 42.7, + 2°.2; 9th, 48°, + 7°.5; 10th, 48°.3, + 7°.7; 11th, 42°.2, + 1°.5; 12th, 44°.8, + 4°; 13th, 48°.1, + 7°.1.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 127½° on the 13th, 123½° on the 12th, and 120½° on the 10th; on the 7th the reading did not rise above 53°.

The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 27½° on the 11th, 31° on the 13th, and 31½° on the 10th; the mean of the seven lowest readings was 34½°.

Wind.—The direction of the wind was variable, and its strength moderately strong.

The weather during the week was fine and dry, except on Sunday, the 7th inst., when it was dull and gloomy, with occasional rain.

Rain fell on the 7th, to the amount of 0.08 inch.

ENGLAND: Temperature.—During the week ending Saturday, March 13, the highest temperatures of the air observed by day were above 60° at Blackheath (London), Bristol, Cambridge, and Sunderland, and below 52° at Wolverhampton, Sheffield and Liverpool; the mean value from all stations was 57°.

The lowest temperatures of the air observed by night were below 32° at Cambridge, Wolverhampton, Nottingham, Sheffield, and Hull, and above 39° at Plymouth and Brighton; the mean value from all places was 34½°.

The extreme range of temperature in the week was above 27° at Blackheath, Nottingham and Hull, and below 18° at Plymouth and Liverpool; the mean range of temperature from all stations was 22½°.

The mean of the seven high day temperatures was above 54° at Truro, Brighton, Blackheath, and Cambridge, and below 49° at Wolverhampton, Sheffield, Liverpool, Bradford, and Leeds; the general mean from all places was 51½°.

The mean of the seven low night temperatures was below 38° at Cambridge, Wolverhampton, Nottingham, Sheffield, Liverpool, and Hull, and above 43½° at both Truro and Plymouth; the mean from all stations was 39°.

The mean daily range of temperature in the week was above 17° at both Blackheath and Cambridge; and below 10° at Plymouth, Sheffield, Bradford, Leeds, and Sunderland; the mean daily range from all places was 12½°.

The mean temperature of the air for the week from all stations was 44½°, being 3½° higher than the value for the corresponding week in 1879.

The mean temperature was above 46° at Truro, Plymouth, Brighton, and Blackheath, and below 42° at Wolverhampton, Sheffield, Liverpool, and Hull.

Rain.—The amounts of rain measured during the week were small everywhere. At Truro the total fall was 0.43 inch, and at Hull 0.33 inch, at Cambridge, Norwich, and Wolverhampton 0.04 inch only was measured; the average fall over the country was 0.20 inch.

The weather during the week was generally fine and dry, though the sky was very cloudy at times. Fog was prevalent at some places.

SCOTLAND: Temperature.—During the week ending Saturday, March 13, the highest temperatures of the air observed by day varied from 50° at Dundee, to 51½° at Aberdeen; the mean value from all places was 55½°.

The lowest temperatures of the air observed by night varied from 29° at both Paisley and Perth, to 33½° at Greenock; the mean value from all stations was 31½°.

The mean range of temperature in the week from all places was 23½°.

The mean temperature of the air for the week from all stations was 42½°, being 5½° higher than the value for the corresponding week in 1879.

The mean temperature was above 43° at Glasgow and Leith, and below 42° at Paisley and Perth.

Rain.—The heaviest falls of rain were at Paisley, 1.36 inch, Greenock, 1.25 inch, and Dundee, 1.05 inch; and the least falls were at Aberdeen, 0.43 inch, and Edinburgh, 0.55 inch; the average fall over the country was 0.90 inch.

DUBLIN.—The highest temperature of the air was 57½°, the lowest 30½°, the extreme range 26½°, the mean 42½°; and the fall of rain 0.98 inch.

JAMES GLAISHER, F.R.S.

Variorum.

CLEVERNESS OF A SOLDIER-ANT.—One cannot walk anywhere in the neighbourhood of Bahia without seeing these leaf-cutting ants (Ecodoma) at work. Their habits have been described by many observers, and recently by Mr. Belt\* at great length. One soldier-ant was carrying a piece of young Cassava root, 2 inches in length. It held the stick by one end thrown over its back, but not touching it, the other end projecting far behind the insect. There was just a balance. The slightest extra weight on the hinder tip of the stick would have upset the bearer backwards. The ant staggered from side to side under its burden, like a heavily laden porter, and got along very slowly. I pulled the burden away and then put it back again. The ant struggled a long while to get it back into its old position, but could not. Then it tried to balance it crossways by the middle, but one end always tilted up, and the other stuck against the ground, so at last the ant cut the stick in two, and carried off one half, a worker hoisting the other. Notes of a Naturalist on the "Challenger."

VEGETABLES PRESERVED BY DRYING.—A convenient method of preparing desiccated vegetables, as practised largely in some countries, consists in drying them for a short time, and then exposing them to a slow heat in ovens. When soaked for cooking, Peas, Koots, Potatos, Beets, corn, and other substances swell out and show very little change in their esculent properties. A modification of this process consists in placing the substances, after being sun-dried, in paper bags, which are pasted up at the mouth, and then covered with sand, and heated till perfectly crisp, but not burned or materially altered in colour. Cassell's Dictionary of Cookery.

Enquiries.

He that questioneth much shall learn much.—BACON. BIRD SCARER.—J. J. would be much obliged if any one who has tried the "Infallible Bird-Scarer," sold by Messrs. Hill & Son, 4, Haymarket, W., and illustrated in the Gardeners' Chronicle for February 1, 1879, p. 149, would give their experience as to its effectiveness.

Answers to Correspondents.

CARPET BEDDING PLANTS: E. T. R. The only dark or purplish-brown coloured hardy dwarf "carpeting" plants are Ajuga reptans purpurea and Oxalis corniculata rubra, both excellent for the purpose; the former increase by division, and the latter from seed, which, if sown now on a warm border, will be ready to plant out by bedding time. The only other dwarf plants suitable for carpet bedding that can be raised from seed in time for the present season's planting, are the well-known Pyrethrum Golden Feather and Tagetes signata punctata; the last has beautiful green foliage, and can be kept as dwarf as may be desired by repeated trimming; Iresine acuminata is probably the kind you mean; it is of more compact growth than Lindenii, but not so bright. Alternantheras will not survive the winter with a less temperature than 55°. In such a temperature, and kept on the dry side as to atmospheric moisture, they are sure to winter safely.

CINERARIAS: Kelway & Son. A good showy decorative strain, mostly with a black disc, but not sufficiently refined to take position as florists' flowers.

FUNGUS: J. F., Hill Court. The name of the fungus is Hypoxylon fuscum.

LIQUID MANURE: C. H. D. A safe rule for the guidance of those who are inexperienced in the use of liquid manures is to apply whatever kind of fertiliser may be used "weak and often." If it be guano, half an ounce to 1 gallon of water will be found a safe proportion. The urine of horses and cows should be diluted heavily—say 1 pint to about 2 gallons of water. One peck of sheep's droppings, and a handful or two of soot, well mixed in 30 gallons of water, and used when clear, would prove a useful manure.

MEASURING THE HEIGHT OF TREES.—E. J. S., Tauxon. You will find some details for making a very simple and useful instrument for this purpose in our number for August 2, 1879, p. 156.

NAMES OF PLANTS: H. Powell. Helleborus viridis—the wild native species, generally found in limestone districts.—R. Andraes. Rhododendron arboreum, and Sparmannia africana.—A. Daniels, 1, His japonica, commonly known as L. chinensis; 2, Isoplepis gracilis; 3 and 4, Libonia floribunda; 5, Halbrothamnium fasciculatum; 6, Pteris cretica, var. albobolobata.—J. G., 1, Saccolabium calceolare; 2, Fria linata; 3, Dendrobium prunellinum.—Mrs. A. One of the forms of Asphodelus albus.—C. H. D., 1, Pulmonaria officinalis; 2, P. angustifolia.—P. A. F. Scilla bifolia (true).—H. C., 1, Polygodium serpens; 2, Hydrocotyle elongata; 3, Piper excelsum; 4, material insufficient; 5, Dodonaea viscosa; 6, Myoporum laetum. The name "Tutu" is given to the

various species of Coriaria; but probably the species you mean is C. ruscifolia.—J. Enticoffmann. Probably Dendrobium fimbriatum oculatum; but you do not give any particulars as to its habit.

PEAR GLOT MORCEAU: P. A. F. The name is spelt in this way by all the best English authorities, so that the fruit-sellers are only following a well set precedent. In France there are at least half a dozen different ways of spelling the word.

RECOVERING A DEBT: R. Nisbet. We presume the debt is recoverable through the county court; but you had better get the advice of a solicitor upon the matter.

VINES: H. B. H. The roots have perished through the border being constantly saturated with moisture, not from any deleterious properties in the cold tea, or tea-leaves. Discontinue the practice described, and replace the soil with some fresh loam.—A Contributor. To ripen the wood of Vines, the more air and heat you give them the better. If your Vines grow well, these are the elements to produce "plump eyes close to the Vines." It matters not about their exposure in winter if the wood is ripened properly. We suspect your Vines ripened badly last autumn.—R. P. Wright. The cause of your Vines breaking so badly is owing to their being improperly ripened last autumn.

WORMS ON LAWN: Leham. The corrosive sublimate should have been effectual. Another plan is to water with a saturated solution of caustic lime. We have also used with good effect a solution made from a worm soap sold by Messrs. Rutley & Co., of the Strand. Possibly your garden, like many others manufactured by speculative builders, is made up of all sorts of crudities and ineffectually drained. If so, the first step towards improving your lawn would be to drain the plot well, then to have the soil thoroughly broken up, keeping the best near the top, some good earth if necessary being spread on the surface, and then to have it returned, but this should be done at once, or deferred till next season.

Markets.

COVENT GARDEN, March 18.

The recent fine weather has brought a large supply of forced goods into the market, and with short demand, owing to the coming elections, prices have fallen considerably, late Grapes alone maintaining their value. Outdoor vegetables are more plentiful. James Webber, Wholesale Apple Market.

Table with 3 columns: Fruit, s. d. s. d., and s. a. s. d. Items include Apples, Oranges, Pears, Pine-apples, Strawberries, Lemons.

Table with 3 columns: Vegetables, s. d. s. d., and s. a. s. d. Items include Artichokes, Asparagus, Herbs, Lettuces, Cabbages, Mushrooms, Onions, Beet, Brussels Sprouts, Parsley, Peas, Carrots, Cauliflowers, Celery, Chis, Cucumbers, Endive, Garlic.

Potatos:—Regents, 100s. to 145s.; Flukes, 120s. to 160s.; and Champions, 150s. to 190s. per ton. German, 6s. to 7s. 6d. per bag; new English, 2s. per lb.

Table with 3 columns: Plants in Pots, Wholesale Prices, s. d. s. d., and s. a. s. d. Items include Arum Lilies, Azaleas, Begonias, Bouvardias, Cinerarias, Cyclamen, Cyperus, Plectytra, Dracena terminalis, Erica gracilis, Euonymus, Ferns.

\* The Naturalist in Nicaragua, by Thos. Belt, p. 471 et seq. London: John Murray, 1874.

SEEDS.

LONDON: March 16.—Messrs. John Shaw & Sons, of 37, Mark Lane, state that owing to the favourable weather a daily increasing activity now prevails on the seed market, and for all the leading varieties there is naturally a heavy consumptive demand. American red Clover can now be bought on Mark Lane at unusually moderate prices. The quality of the seed this season proves highly satisfactory. From Chicago the shipments of grass seeds during 1879 were 47,361,744 lb. White Clover is rather dearer. Fine qualities are not over plentiful. There is also a somewhat better feeling for Trefoil. Italian and perennial Rye-grasses are unchanged. There is more inquiry for Lucerne. Santoin continues scarce. Spring Tares, being in short supply, have advanced 2s. per quarter. As regards Canary, Hemp, Millet, Haricots, Lentils, and Peas, the business doing therein is too limited to call for remark.

CORN.

At Mark Lane on Monday trade was rather firm, but there was not much business in progress. Wheat was held for 1s. per quarter advance, but the improvement was realised in only a few instances. Barley moved off slowly on former terms. Maize was steady, without much sale. Oats were firm; Russian fetched about 3d. per quarter more money, and Swedish (which were especially scarce) from 6d. to 1s. per quarter. Maize supported the full prices of last week, but the demand was quiet. Beans and Peas were steady, while no change was reported in flour.—There was no material change in the position of the market on Wednesday, but the tone was perhaps a trifle weaker. As regards Wheat, in the few sales concluded the rates of Monday were about maintained. For Barley prices were unaltered. Oats were steady, good Swedes being again scarce and quite as dear. Maize was rather dull, and very little demand for Beans, Peas, or flour.—Average prices of corn for the week ending March 13:—Wheat, 44s. 8d.; Barley, 34s. 10d.; Oats, 22s. 3d. For the corresponding period last year:—Wheat, 39s. 7d.; Barley, 34s. 1d.; Oats, 20s. 9d.

CATTLE.

At the Metropolitan Market on Monday the quotations of that day seem night for beasts were well supported, and some choicest qualities reached 6s. For sheep the demand was good, prices were therefore higher. A considerable number of shorn were pretty readily disposed of at about 1s. per 8 lb. less than those in the wool. Some choice lambs on offer made over 1s. per pound. Choice calves were scarce.—Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 5s. 10d.; calves, 5s. 4d. to 6s. 8d.; sheep, 5s. 2d. to 5s. 8d., and 6s. 4d. to 7s.; pigs, 3s. 6d. to 5s.—Thursday's market was in a quiet state. Supplies were short, and were entirely composed of home-bred stock. Both beasts and sheep sold slowly at about late rates. Calves were quiet.

HAY.

Tuesday's Whitechapel Market report states that there was a steady demand for fodder, and the better qualities of Clover, which were scarce, realised somewhat higher prices.—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 83s. to 100s.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—On Thursday there was a fair supply on sale. The trade was dull for low sorts, but for the best prices were firm.—Cumberland Market quotations:—Superior meadow hay, 100s. to 110s.; inferior, 40s. to 75s.; superior Clover, 120s. to 130s.; inferior, 84s. to 108s.; and straw, 36s. to 40s. per load.

POTATOS.

From the Borough and Spitalfields Markets reports we learn that trade has been steady. Good descriptions have been in moderate demand, and prices have been maintained. Scotch Regents, 140s. to 160s.; Champions, 175s. to 185s.; Lincolns, 170s. to 180s.; Victorias, 160s. to 180s. per ton. German reds, 6s. 6d. to 8s. 6d., and Dutch rocks, 5s. 6d. per bag.

COALS.

The following are the quotations current at market during the week:—East Wylam, 15s.; Bebside West Hartley, 14s. 3d.; Walls End—Hetton, 14s. 6d. and 15s.; Hetton Lyons, 13s. and 13s. 6d.; Hawthorns, 13s. 3d.; Lambton, 14s. and 14s. 6d.; Original Hartlepool, 15s.; Wear, 13s. and 13s. 6d.; South Hetton, 14s. 6d.; Vanes, 13s.; Chilton Tees, 13s. 6d. and 14s.; Radford Navigation, 15s. 9d.; Caradoc, 14s. 9d.; Tees, 14s. 9d.

Lawn Mowers — Lawn Mowers.

THE GREAT SUPERIORITY OF GREEN'S PATENT "SILENS MESSOR" "MONARCH" LAWN MOWERS

Over those of all other Markers is universally acknowledged. They will Cut Either Short or Long Grass, Bents, &c., Wet or Dry. These advantages no other Lawn Mowers possess.

They have been in constant use for upwards of twenty years in The Royal Gardens, Windsor, Buckingham Palace Gardens, Marlborough House Gardens, Royal Horticultural Society's Gardens, South Kensington, The Royal Botanic Gardens, Regent's Park, The Crystal Palace Company's Gardens, Sydenham, The Winter Palace Gardens, Dublin, The Hyde Park Gardens, Hampton Court Gardens, The Zoological Gardens, Regent's Park, The Dublin Botanic Gardens, The Liverpool Botanic Gardens, The Botanic Gardens, Brussels, The Hall Botanic Gardens, The Leeds Horticultural Gardens, And in most of the Principal Parks and Squares in the United Kingdom.

They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

The above machines have proved to be the best, and have carried off Every Prize in all cases of Competition.

Every Lawn Mower is guaranteed to give entire satisfaction, otherwise it may be returned at once, free of cost to the purchaser.

Prices of Horse, Pony, and Donkey Machines, on application. They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the manufacturers. Carriage paid to all the Principal Railway Stations in the United Kingdom.

Illustrated Price LISTS free on application. N.B.—Those who have Lawn Mowers to Repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths. SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

DOULTON & CO., LONDON, S.E.

**Hurry's Daisy and Weed Extractor,**

FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little invention.

The following particulars, from the *Gardeners' Chronicle* of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of Mr. ALFRED F. O'C. HURRY, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: THOMAS TILLEY, 12, Walbrook, London, E.C. Cambridge Agents: G. BEALES & CO.;

Or Carriage Free of the Inventor on receipt of P.O.O. for 4s. 3d. and 5s. 3d., payable at Cambridge or Sawston.

ALFRED F. O'C. HURRY, PATENTEE, PAMPESFORD, CAMBRIDGESHIRE.

**X PIPES.—PIPES.—PIPES. X**  
The Cheapest House in the Trade for HOT-WATER PIPES and CONNECTIONS. F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required. From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

TWO GOLD MEDALS  
Awarded to us by  
Royal Horticultural Society.

At the Grand Show at Preston  
July, 1878.  
Out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last

a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

**KINAHAN'S LL WHISKY.**  
 Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.**  
 Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
 Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*  
**JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**  
 This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
 The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
 and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S PILLS.**—The chief wonder of modern times.—This incomparable medicine increases the Appetite, Strengthens the Stomach, Cleanses the Liver, Corrects Bilioousness, Prevents Flatulency, Purifies the System, Invigorates the Nerves, and Reinstates Sound Health. The enormous demand for these Pills throughout the globe astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race. They are a blessing to the afflicted, and a boon to all who labour under internal or external diseases. The Purification of the Blood, Removal of all R. strain from the Secretive Organs, and gentle aperitive actions are the extensive curative range of Holloway's Pills.

SALES BY AUCTION.

Cheltenham.

HIGHLY IMPORTANT SALE of probably the grandest Collection of STOVE and GREENHOUSE SPECIMEN EXHIBITION PLANTS ever submitted to public competition.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, without the slightest reserve, in the large Pittville Pump Room, Cheltenham, Gloucestershire, on WEDNESDAY, March 31, and THURSDAY, April 1, at 11 for 12 o'Clock precisely each day, by order of Ed. Pilgrim, Esq., who is giving up exhibiting, the whole of the unrivalled Collection of SPECIMEN EXHIBITION PLANTS, which have been exhibited with unprecedented success at the leading shows throughout the country.

The stock may be viewed any day prior to the Sale. Catalogues may be had (price 6d. each, returnable to purchasers) of Mr. HAMLET, Head Gardener, Fern Lawn, Pittville, Cheltenham; and of the Auctioneers, Estate Agents, and Valuers, 98, Gracechurch Street, London, E.C., and Leytonstone, E.

Important Sale of a First-class Collection of CARNATIONS, PICOTEES, PINKS, and CLOVES, 500 Standard and other ROSES, selected FRUIT TREES, hardy CONIFERAE, SHRUBS, and AMERICAN PLANTS, GREENHOUSE PLANTS, DAHLIAS, choice SEEDS, LILLIUMS, RANUNCULUS, ANEMONES, &c.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION the above, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on THURSDAY, April 1, at 12 o'Clock precisely. On view the morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 98, Gracechurch Street, E.C., and Leytonstone, E.

Important Sale of Orchids. MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY, April 5, 400 lots of ESTABLISHED ORCHIDS, mostly from private Collections, for Sale without reserve; also several very fine DRACÆNA GOLDIÆANA, and other PLANTS.

Further particulars next week. Catalogues of the Auctioneers, at the Mart, or 98, Gracechurch Street, E.C.

Established Orchids. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 8, at half-past 12 o'Clock precisely, a choice COLLECTION of ORCHIDS, the property of a Gentleman, in excellent health, comprising many fine Plants of the best species and varieties in cultivation, many of which will be in or showing flower.

Reigate. To GREENGROCCRS, FRUITERS, and OTHERS. TO BE SOLD, at once, the LEASE and GOODWILL, with STOCK and FIXTURES, of a GREENGROCER'S and FRUITERER'S BUSINESS. Rent £20 per annum, including Shop and Dwelling-house, with four Bed-rooms, Stabling, and Out-buildings. Also the LEASE, STOCK, and GREENHOUSES, on a valuable plot of Nursery Ground near the Station. For further particulars, apply to ROBT. W. FULLER and MOON, Auctioneers, Reigate.

Patron: H. R. H. THE PRINCE OF WALES, K. G. President (1879-80): The EARL of COVENTRY.

WORCESTER MEETING, 1880. Commencing WEDNESDAY, June 2; terminating MONDAY, June 7. Horticultural Department.

In requesting your assistance for the Horticultural Exhibition at the forthcoming Meeting of Worcester, by the LOAN of PLANTS, &c., the Steward of that Department begs to state that, in order to obviate the objections so often made against the system of Exhibiting Plants in competition for Money Prizes, it has been determined to give sums of Money, in proportion to the importance and value of the Plants exhibited, as gratuities to Exhibitors' Gardeners.

All Plants must be staged in their allotted places on TUESDAY, June 1, or not later than 10 A.M. on WEDNESDAY, June 2. The Tent in which the Plants will be exhibited is closed with glass ends and well ventilated, so as to afford perfect security to the most delicate flowers. Any further information may be obtained on application to the Steward, The Hon. and Rev. J. T. BOSCAWEN, Lamoran, Probus, Cornwall.

SEED POTATOS. Plant the Great Disease Resisting "CHAMPION." MR. R. BATH has 60 Tons for disposal, 12s. per cwt., 7s. per bushel, 3s. per peck; well sorted ware at the same prices, bags included. New Cucumber, Sir Garnet Wolseley.
JOSEPH HAMILTON AND SON, Wellington Place, near Carlisle, will supply SEEDS of the above, in Packets of 6 Seeds, post-free for 30 stamps.
"The points in which Cucumber Sir Garnet Wolseley surpasses all other long-fruited varieties are the symmetry of its fruit, and the abundance with which they are produced; there being no shank or handle to Sir Garnet."—Gardener's Chronicle, September 27, 1879.

To the Trade.
"PRIDE OF ONTARIO" POTATO.
H. AND F. SHARPE are now offering the above excellent POTATO, grown from their original stock. It gave universal satisfaction last season, having produced a fine yield, and comparatively free from disease. As the stock this season is limited early orders are requested.
Seed Growing Establishment, Wisbech

Cemetery Nursery, Gravesend.

TREES FOR AVENUE, PARK, or STREET PLANTING.
ACER PASCARPUM, 14 to 16 feet, girth 5 to 7 inches.
CHESTNUT, Horse, 12 to 14 feet, girth 5 to 7 inches.
" Horse, 14 to 16 feet, girth 8 to 10 inches.
" Horse, Scarlet, 10 to 14 feet, girth 6 to 8 inches.
LIMES, 14, 15, 16, 18, and 20 feet, girth 6 to 10 inches.
PLANES, Occidental, 10 to 12 feet, girth 4 to 5 inches.
" Occidental, 12 to 14 feet, girth 5 to 6 inches.
A few hundred splendid PLANES, 16 to 18 feet, girth 8 to 10 inches.
POPULUS CANADENSIS NOVA, 12 to 14 feet, girth 6 to 8 inches.
MAPLES, Norway, 12 to 16 feet.
BEECH, Purple, 10 to 12 feet.
OAKS, Scarlet, 10 to 12 feet.
CHESTNUTS, Spanish, 10 to 12 feet.
SYCAMORE, 12 to 15 feet.
They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe.
The girth of the stems is taken at 4 feet from the ground, and not at the case, which is often deceptive.
ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

SPRING FLOWERING PLANTS.
PRIMROSE, double: crimson-purple, 6s. per dozen, 45s. per 100; yellow, 3s. per dozen, 20s. per 100; lilac, 2s. 6d. per dozen, 16s. per 100; white, 3s. per dozen, 20s. per 100.
single, crimson (fine), 2s. 6d. per dozen, 16s. per 100.
POLYANTHUS, 2s. 6d. per dozen, 16s. per 100.
AURICULAS (alpine, fine), 3s. per dozen, 20s. per 100.
MYOSOTIS ALPES TRIS COMPACTA (very dwarf, 3 inches fine), 2s. per dozen, 10s. per 100.
VIOLET, Victoria Regina (strong clumps), 4s. per dozen, 25s. per 100.
HEPATICA, single blue, 3s. per dozen, 20s. per 100.
PHLOX SETACEA (strong), 4s. per dozen, 25s. per 100.
IBERIS SEMPERVIRENS, 3s. per dozen, 20s. per 100.

## POTATO DISEASE—POTATO DISEASE.

**GYDE'S AMAZONAS SANA COPIA, or  
DISEASE-RESISTING POTATO MANURE.**

The very best Manure ever manufactured for the Potato.

See *Farm Journal*, February 17, 1880.

"Brockley, Kent, September 15, 1879.

"Dear Sir,—We have tried the Amazonas Sana Copia Potato  
Manure supplied by you, and have much pleasure in stating  
that the produce of Potatoes was three times the quantity to  
those grown with the aid of stable manure. The tubers are  
much larger in size, of fine quality, and little affected by  
disease.—Yours faithfully,  
"BANTIN BROTHERS.

SEED GROWING ESTABLISHMENT,  
WISBECH,

## PROSPECTUS OF THE GENERAL HORTICULTURAL COMPANY—(Continued from p. 392).

5. To purchase from its Shareholders, at fair market prices, such plants, cut flowers, fruit, vegetables, &c., as they may wish to dispose of, as well as all plants which may have outgrown their establishments, and which are suitable for the purposes of the Company, and to supply the Shareholders with vegetables, fruit, flowers, plants, seeds, &c., implements, and other garden requisites, on the same principles as Co-operative Associations.
6. To establish and maintain a School of Instruction for the training of young gardeners, for which purpose the Company's Nurseries and Gardens will be utilised.
7. A Register of thoroughly practical competent Gardeners will be kept, and facilities offered the Shareholders of obtaining men of character and ability.

A provisional Contract, dated March 17, 1880, between John Wills of the one part, and William John Smith, on behalf of the Company, of the other part, has been entered into for the purchase of the undermentioned leasehold Nurseries, his plant, contracts, stock and utensils-in-trade, and goodwill of his business for the sum of £35,581, of which £11,000, representing a portion of the goodwill, and the beneficial interest in the leases of the Nurseries, will be taken by him in fully paid-up shares. The balance to be paid in cash.

The purchase-money is based upon a valuation made by Messrs. Protheroe & Morris, of 98, Gracechurch Street, E.C., which may be seen at the Company's Office.

No promotion money has been or will be paid; the only preliminary expenses up to allotment will be those of Registration, Advertising, Printing, Legal Charges, &c.

The existing Est ablishments are :—

### I.

## THE EXOTIC NURSERY AND WINTER GARDEN,

AT ONSLOW CRESCENT, SOUTH KENSINGTON.

*Held on Lease, for a term of which forty-three years were unexpired at Michaelmas, 1879, at an annual rent of £90.*

Besides the handsome Winter Garden there are **six large** glasshouses at this Nursery, and a commodious Flower Shop, with large Stores beneath the Conservatory.

### II.

## SUSSEX PLACE NURSERY,

ONSLOW SQUARE.

*Held on Lease for a term of which twelve years were unexpired at Michaelmas, 1879, at an annual rent of £91.*

This Nursery is well stocked with Forest Trees, Shrubs, and various other plants suitable for the purposes of the business. There are **five large plant-houses**, and adjoining it a large Yard with convenient Stabling and Van Sheds.

### III.

## FULHAM NURSERY,

IN THE FULHAM ROAD, HAMMERSMITH.

*Held under two Leases, one for a term of which seventy-two years were unexpired at Christmas, 1879, at an annual Ground Rent of £60, and the other for a term of which fifty-one years were unexpired at Michaelmas, 1879, at an annual rent of £140.*

At this Nursery there are altogether **seventeen ranges** of Glass. Many of the houses are very large, and contain immense collections of plants. There are also convenient Stables, Van Sheds, large Carpenters' and Painters' Shops, Potting Sheds, &c.; the principal portion of the ground not covered with glass is planted with large numbers of the best kinds of Roses and other suitable plants and shrubs for the supply of cut flowers.

### IV.

## THE MELBOURNE NURSERY,

ANERLEY ROAD, S.E., NEAR THE CRYSTAL PALACE.

*Held on Lease for a term of which fourteen years were unexpired at Christmas, 1879, at an annual rent of £250.*

This Nursery is situated in the Anerley Road, near the Crystal Palace, and is about two and a half acres in extent, nearly one acre being planted with the best kinds of Roses, from fifteen to twenty thousand blooms being frequently supplied from this Nursery in one day.

There are also nine Plant-houses 100 feet long, varying in width from 12 to 18 feet, and two long ranges of Glass: all these houses are filled with plants. It is proposed to erect three or four more ranges of glass at this Nursery, in order to more fully develop the production of new plants, the Manager of this part of the establishment (Mr. Bause) being one of the most skilful propagators in Europe.

The whole of the buildings enumerated above are erected, ventilated, and heated in the best possible way, the latest improvements in all cases being adopted.

**The Lease of twenty-one years of those noble and commodious premises, known as Warwick House, Regent Street, W., has been secured for the purposes of a central depot.**

It is proposed, if necessary, to acquire **One Hundred or more Acres of Fertile Land Thirty Minutes by Rail from Paddington and the West End Stations**, and establish thereon a **large Market Garden and Nursery**, from which the Shareholders requiring them would be supplied daily with **fresh Flowers, Fruits, Vegetables, &c.**, at 10 per cent. upon cost prices for monthly payments.

Mr. Wills has agreed to act as the Manager of the Company, so that the business will continue to benefit by his acknowledged taste and experience.

PROSPECTUSES and FORMS of APPLICATION for SHARES can be obtained of the Bankers and Solicitors of the Company, and at the **Company's Temporary Offices, 16, Onslow Crescent, S.W.**; and the Contract above referred to, and the Articles of Association of the Company can be inspected at the Offices of the Solicitors.

THIS Company has been formed for the purpose of acquiring and working the business of Mr. JOHN WILLS, the well-known Horticulturist. The success of Mr. WILLS as an artistic floral decorator, nurseryman, and landscape gardener is well known, the principal floral decorations for many years past, both in private houses and on the occasion of great public fêtes, having been placed in his hands, and carried out under his personal supervision. Two Grand Prizes of Honour and Seventy First Prizes were awarded to him at the Paris Exhibition of 1878, and at Versailles.

Although the business has only been established ten years it has become the largest of its kind in the world, the names of no less than two thousand six hundred customers being enrolled now on the books. The contracts Mr. WILLS has now in hand, and which are of a highly valuable character, will be transferred to the Company.

The objects which the Company have in view are :—

1. The development of horticulture in all its branches, and the furtherance of a more widespread demand for flowers for decorative and other purposes, and the cultivation and supply of Fruits, Vegetables and Seeds.
2. The introduction, propagation, and distribution of new plants.
3. The furnishing of plans, specifications, and estimates, together with the superintendence and erection of all kinds of horticultural buildings, and furnishing the same.
4. General landscape gardening, and all kinds of ground-work ; and generally the management and improvement of every description of garden and orchard.

THE **Gardeners' Chronicle.**

SATURDAY, MARCH 27, 1880.

ALLOTMENT GARDENS.

OF late years the tendency of city and metropolitan improvements has been to drive the poorer classes from the centre to the circumference, and they are now being grouped in large communities in several neighbourhoods. If allotment gardens are to be provided near some of these there is great necessity for its being done at once, ere all the open spaces are covered by the builder. It has recently been stated that during 1879 something like 11,000 new houses were built within the metropolitan area, and that this is an annual average. This means the absorption into London every year of what is equivalent to a town of large extent.

In addition to supplying, by the establishment of allotment gardens, healthful and elevating recreation for the people, by drawing them away from grosser pursuits and less worthy occupation for their leisure hours, allotment gardens have an inestimable value as open spaces, serving as lungs, by means of which fresh air and necessary ventilation are brought into the social body. The advantages of allotment gardens are so patent that no one would be found to oppose their introduction; the provision of open spaces is a universally acknowledged social necessity, but little is done in the way of securing them. It would be well if in all cases where recreation grounds are established some portion should be set apart as allotment gardens.

Parliament, in its wisdom, has provided the machinery by which allotment gardens can be established. By an Act of Parliament passed on October 15, 1831, 1st and 2d William IV., reciting an "Act of George III. to amend the laws for the relief of the poor," power was given to churchwardens and overseers to provide land for the employment of the poor not exceeding 20 acres, and where such quantity should prove insufficient they were to be at liberty to provide such other quantity not exceeding 50 acres. Proviso made, that no poor inhabitant to whom such land should be let should gain a settlement by reason of his occupying such land.

By Act of Parliament of June 1, 1832, 2d William IV., it was enacted that it should be lawful for the trustees of allotments, together with the churchwardens and overseers in parish vestry assembled, to let portions of such allotments not less than one-fourth of a statute acre, and not exceeding 1 acre, to any one individual, as a yearly occupation from Michaelmas to Michaelmas (and at such rent as land of same quality is usually let for), to such industrious cottagers of good character being day labourers or journeymen legally settled in the parish, and dwelling within or near its bounds, as should apply for the same in manner therein-after mentioned; that the person having land to cultivate must so tend it as to preserve it in a due state of fertility.

That for the purpose of carrying this Act into effect a vestry meeting of the parish should be held in the first week in September in every year, of which ten days' notice should be given in the usual manner, at which meeting such applicant should be admitted a tenant; that the rent should be payable to and received by the churchwardens and overseers on behalf of the vestry at the end of each year; that if the rent should be four weeks in arrear, or the plot of ground not duly cultivated so as to fulfil the useful and benevolent purpose of such Act, then the churchwardens and overseers, with consent of the vestry, should serve notice to quit on any such occupier, and such occupier shall deliver up possession in one week after such notice; that if any occupier should refuse to quit, or if any other person should take possession thereof, complaint should be laid before two justices of the peace, who should issue a summons for such occupier to appear before them, such summons being either personally served on them, or, if not found, affixed to the door of the church, and such justices shall make order in the matter. That all arrears of rent should be recovered by application to such justices, who shall issue their warrant to levy on tenants' goods and chattels. That the rent should be applied in the purchase of fuel to be distributed in the winter season among poor parishioners resident in or near such parish. That no habitation should be erected on any portion of the said land.

Such, then, is the legal machinery by which allotment gardens can be provided, but it is applicable more to rural districts than to the suburbs of London and large cities and towns. Whether municipal corporations, boards of health, rural sanitary authorities, have power to acquire land for allotment gardens is not set forth; but it would appear that they have exercised the power, with the consent of the vestry, jury of copyholders, &c., of setting out portions of common lands as allotment gardens.

At Ealing there are a number of allotment gardens, and they occupy sites of great and increasing value for building purposes. How these allotments were provided may be set forth in a few words.

In November, 1832, soon after the passing of the second Act just recited, Charles James Bloomfield, then Bishop of London, as Lord of the Manor of Ealing, did thereby consent to the enclosure of all those waste and common lands called Ealing Dean Common, containing 20 acres, 2 roods, and 16 perches, in order that the same might be occupied solely in allotments of not more than 1 rood by each person, to be appointed by a committee of management, of whom the vicar of the parish is to be one; the said allotments to be cultivated by the spade. Proviso: That no person is to work on the said allotments on the Lord's Day, on pain of forfeiture. Proviso: That no nuisance be occasioned to the public or occupiers of houses near allotments, and that sufficient space be reserved for roads and good paths, and also for frontages of houses if necessary. This deed was duly executed by the Bishop of London.

By deed of November 27, 1832, made between Sir Hubert Oakeley, Bart., vicar of Ealing, and the major part in value of persons having right of common over the same, after reciting, and by virtue of the above Act of Parliament, did give consent to the enclosure of all the said allotments, in order that the same might be held in not more than 1 rood by each person, as the committee of management (of whom the vicar to be always one) might determine, the same to be cultivated with a spade.

This deed having been duly executed by the major part of such persons having rights of common over said lands, they were laid out as allotment gardens as directed.

The Ealing allotments are something like 150 in number, and in size average one-eighth of an acre each. It is proposed to divide some of them, owing to the inability (or disinclination) of the occupiers to keep them in proper order. This is a matter, however, deserving tender treatment, as for a considerable portion of the year men who have to work twelve hours per day have but little leisure for tilling their ground, and Sunday labour is prohibited. This is a restriction not generally applied to allotment holders, though it does not prevent them gathering the produce of their gardens on Sundays. A person who receives the rents of the allotments is also a kind of overlooker, and it is his business to take note of their condition, and report the same to the committee. There is a large demand for the allotments, and the committee approve of division, where an arrangement to this effect can be come to. The yearly rent paid for each allotment of one-eighth of an acre is 5s.

The local horticultural society gives all possible encouragement to allotment-holders by offering prizes for garden produce at all their shows, and in addition the Baroness de Rothschild and Mrs. Walpole give every year a sum of money divided into twenty prizes for the best kept allotment or cottage garden, the sums ranging from 25s. to 5s. There is always a keen competition for these prizes, and it generally happens that the allotment holders carry off the best. Judges are appointed, who inspect the allotments and award the prizes, their returns being made about the middle of July.

I may here remark that one radical defect in the government of the Ealing allotments is that the committee is a permanent body, appointing to vacancies on their body as they occur, and making no return to vestry or other authority of the moneys received, or of the manner in which they are expended. The committee have the sole power of appointing the tenants of the allotments. I do not mean to insinuate that the rents are improperly expended, but it is a scandal that such a trust should be administered without any returns being made. This is a local matter, deserving of mention as a warning to others who may be contemplating the apportionment of land for allotment purposes.

I have already alluded to the encouragement given by the local horticultural society to allotment holders by offering prizes for produce from their gardens; the result is an extraordinary exhibition of such produce in the month of July, and so numerous are the entries and so keen the competition, that eight and more prizes are awarded in many of the classes; and it is usual to have from twenty to thirty entries in each. Indeed, it is found difficult to find judges who care to enter upon the very difficult task of making the awards in this department of the local show.

Wherever allotment gardens are established, some such encouragement should be given to their holders. The system of giving prizes to the best kept allotments is a praiseworthy one, but the inspection ought to be monthly, and extend from Lady Day to Michaelmas Day. When the inspection is confined to a month or six weeks, the holder may put forth a kind of spasmodic effort to have his allotment in good condition for that period, in order to secure a favourable verdict from the judges, and neglect it for the remainder of the year. It is general good cultivation that should be encouraged, with due regard to judicious and profitable cropping.

In addition, encouragement is given to forecourt cottage-gardeners by means of special prizes for the best kept flower-garden. The Society is indebted to some public-spirited gentleman for these prizes, and they also bring a good competition. As a general rule, flowers

occupy a subordinate position to vegetables, in consequence of the value of the latter as supplying the family aliment to a considerable extent.

That our system of allotment-gardens encourages habits of industry, sobriety, and thrift is placed beyond doubt, and that such desirable results flow from the system is a weighty reason for their more general provision. "Earth is so kind," wrote Douglas Jerrold, "that just tickle her with a hoe and she laughs with a harvest." In establishing allotment-gardens, and in encouraging the best culture, the seeds that will grow and ripen into another harvest are laid in the ground to fructify into habits and desires, elevated in tone and beneficent in their range, and which constitute the evidences of true social progress. *R. D.*

## New Garden Plants.

### MAXILLARIA ARACHNITES, *n. sp.*\*

This is near *Maxillaria pertusa*, Lindl. It is smaller in all its parts, has much shorter bulbs, shorter narrower leaves, the yellowish flower with its triangular acuminate segments bent and twisted, whence I took the name, being reminded of spiders. Lip ochre-coloured with a purple border, and many short streaks and lines; fragile pellucid hairs consisting of almost globular cells stand on both sides of the lip, and several in front of the triangular callus on the lip and disk. I have before me a glorious specimen—nine bulbs, six flowers—kindly sent by Mr. Backhouse, Holgate House, York. The plant was imported from Western New Granada. *H. G. Rehb. f.*

### CELOGYNE HUMILIS (Lindl.) TRICOLOR.

Dr. Lindley has already stated that there are two varieties of this lovely species, one with amethyst, the other with brown marbling on the lip. The first was the original variety, as may be understood by Dr. Lindley's standard work, *Genera and Species Orchidearum*, p. 43. Whatever may be one's opinion about naming varieties, there is no doubt this is a case where an extra name for the variety is wanted, as the orchidist likes to know what he purchases, the colours being so widely distinct. This is no case of naming an individual as a variety. I propose to call this brown-marbled variety tricolor. I have fine fresh flowers of both at hand, kindly sent by Mr. W. Bull. *H. G. Rehb. f.*

### LIPARIS FORMOSANA, *n. sp.*†

Much in the way of the well-known *Liparis bituberculata*, Lindl. (elata, Lindl.), but it has long almost cylindrical bulbs (0.11 : 0.014 m.), oblong acute very crisped and plaited leaves, a sagittate oblong acute lip, with two non-coherent teeth at the base and hyaline square wings to the column, whose anther is simply acute. The peduncle is beautifully purple. The sepals and petals are very light purple with green borders. Lip dark brown with green borders. Column green. Back of mucronate anther deep brown. I have at hand careful coloured sketches of all the details of the fresh *Liparis bituberculata*, which have much assisted me. I well know that Dr. Thwaites, an eminent authority, has combined with *Liparis bituberculata* the obscure *Liparis odorata*, Lindl. (*Malaxis odorata*, W.), founded on the "Kuatton pounam marawara" of Rheede only. I hope to be able to pronounce my opinion on this question at some time with better information than I can do now. Our actual novelty was gathered in Formosa, by Mr. Maries. It has just flowered in the Royal Exotic Nursery of Messrs. Veitch & Sons (March 7). *H. G. Rehb. f.*

\* *Maxillaria arachnites*, *n. sp.*—*Affinis* *Maxillariæ pertusæ*, Lindl. : pseudobulbus oblongus obtuse acicupitibus, monophyllis (0.035 : 0.01). folio petiolari basi angustissima cuneato ligulato acuminato; pedunculo breviori paucivaquato; ovario vulgo ex bractea artusculata exserto; sepalis triangulo acuminatis (0.03 longis, basi 0.008 latis); tepalibus paulo brevioribus, subfalcat, omnibus curvatis tortisve; labello oblongo antice trilobato, lacinis lateralibus obtusangulis antice crenulatis; lobo mediano parveto undulato crenulato acutiusculo, carnosissimo; callo ligulato a basi ad medium, ibi abrupte acuto, utraque, labelli superficie pilis sparsis articulatis crystallinis fragilibus circumspersis seu aggregatis. Neo Granada. *H. G. Rehb. f.*

† *Liparis formosana*, *n. sp.*—Pseudobulbo cylindraceo basi incrassato; foliis quaternis oblongis acutis, toto margine crispulis; pedunculo pluriangulato superne racemoso; bracteis ligulatis acutis ovaria petiellata non requantibus; sepalis impari ligulato obtuse acuto, sepalis lateralibus subequalibus curvatis; labello cuneato oblongo elliptico acuto breviter sagittato, callis depressis triangulis geminis in basi; columna arcuata, alis quadratis hyalinis juxta foveam; anthera mucronata. In insula Formosa del. cl. Maries. Culta a dom. cel. Veitch. *H. G. Rehb. f.*

EUCALYPTUS COCCIFERA.

SOME time ago we were enabled, through the kindness of Mr. Powell, gardener to the Earl of Devon, Powderham Castle, Devonshire, to lay before our readers an illustration of a fine tree of this species (see vol. xii., 1879, p. 113). Anxious to know how the tree had fared during the winter, we applied again to Mr. Powell for information. Mr. Powell replies the tree "was not in the least injured by frost, although unprotected. The lowest temperature registered was 16°." We are now able to give an illustration of the foliage and flowers of this species, taken from the Powderham tree at the end of January last (fig. 69). In a letter accompanying the specimen, Mr.

INTERNATIONAL POTATO EXHIBITION.

WHEN it became known that purchases of seed Potatoes would be made for restocking those districts of Ireland which had suffered most severely from the failure of the Potato crop last year, the committee of the International Potato Exhibition determined to offer their services to the Government, both as advisers and agents, if need be, in this matter. The proposal had the sanction of the Lord Mayor of London, who is the President of the Exhibition, as also of the Vice-Presidents, Mr. Alderman Hadley, Messrs. James Abbiss, Shirley Hibberd, Peter McKinlay, and James Crute, Esq., the Treasurer. Accord-

February 19, 1880, Shirley Hibberd, Esq., presiding, it was resolved—

"To respectfully inform Her Majesty's Government that this committee has been formed 'for the encouragement of the best means of Potato culture and the introduction and diffusion of improved varieties' of Potatoes. During the past six years this committee has, by means of exhibitions, enquiries, and experiments, acquired a considerable amount of experience, which, it is hoped, may be rendered advantageous to national interests. The schedule of the forthcoming sixth International Exhibition of Potatoes, which accompanies this memorial, will show that this committee has more than a passing or theoretical interest in the subject.

"Being in communication with the principal growers of seed Potatoes in all parts of Great Britain and the United States of America, this committee would esteem

FIG. 69.—EUCALYPTUS COCCIFERA: FLOWERS PALE YELLOW.

Powell writes:—"When gathering the enclosed specimen I observed that the flower-buds are now forming for flowering in the year 1881. Those for this year are in a more advanced stage than those forming the subject of your former illustration. On a portion of the old wood may be seen a few bunches of seed-vessels from flowers of last year. I have tried to propagate from the seeds, but they fail to germinate."

The tree in question is fully described in Hooker's *Flora of Tasmania*, i., 133, and also in Bentham's *Flora Australiensis*, vol. iii. (1866), p. 204. A good figure will be found in the *Botanical Magazine*, t. 4637. It is a native of the mountains of Tasmania, and is a small tree with lanceolate acuminate or obtuse glaucous foliage, tufts of pale yellow flowers, each with a top-shaped flower-tube, surmounted by a very short, flat, broad lid or "operculum," which falls off, revealing the numerous stamens.

ingly, on February 19 last, a meeting was held at 108, Queen Victoria Street, London, when there were present Messrs. Barr, Hooper, Earley, McKinlay, Hibberd, Crute, and McKenzie, and resolutions were agreed to in accordance with the primary proposition.

The following letter was then despatched to the Home Secretary:—

"To the Right Honourable Richard Assheton Cross, Her Majesty's Secretary of State for the Home Department.

"Sir,—The committee of the International Potato Exhibition have had under consideration the advisability of offering their services to Her Majesty's Government and those acting under authority, with a view to facilitate the selection of suitable varieties of seed Potatoes for distribution in Ireland. Accordingly, at a meeting held at 101, Queen Victoria Street, London, on

it an honour to be permitted to advise and practically assist in the selection of sorts best adapted to the soils and climates of the districts in need of supplies, with a view to preventing the constant deterioration of the Potato plant, which, not only in Ireland, but throughout the United Kingdom, in great degree results from the use of degenerated seed.

"This committee, therefore, is prepared to submit to Her Majesty's Government such recommendations as appear suitable to the present emergency, and would gladly, by deputation, wait on you at any time you might be pleased to appoint.—I have the honour to be, sir, your most obedient servant,

J. A. MCKENZIE, *Secretary*,

"Tower Chambers, Moorgate Street, London, E.C."

The communication was by Mr. Cross forwarded to the Irish Government, and obtained the prompt attention of the Lord-Lieutenant, by whom it was placed in the hands of the Local Government Board,

Dublin. The Board, through Mr. B. Banks, secretary, informed the committee of the International Potato Exhibition that any information or recommendations supplied by the committee would be accepted gladly and communicated to the Boards of Guardians in Ireland engaged in providing seed for the occupiers of land in their unions.

On receipt of this communication the sub-committee to whom the matter was referred prepared and have forwarded to the Local Government Board, Dublin, the following

#### RECOMMENDATIONS.

1. The land intended to be planted with Potatoes should be effectually drained, for if it become saturated with moisture at any time while occupied with the crop, disease is likely to ensue. The neglect of drainage in Potato culture has been so largely attended with disappointment and disaster that it is impossible to over-rate the importance of the subject.

2. The land should be prepared by deep digging and liberal manuring with whatever cheap fertilisers the district will readily afford. The cow-hyge and pigstye should be regarded as supplying life to the Potato crop. Weeds and parings of Heath soil burnt in small heaps carefully stopped with earth or clearings of ditches to prevent flame, will furnish an excellent fertiliser at little cost, and suitable for every kind of soil. Where the land is poor and sandy, a mixture of kainit and superphosphate of lime, to be used at the rate of from 3 to 5 cwt. per acre, would be likely to prove highly valuable in aid of the crop. In places contiguous to the sea the people should be encouraged to manure their Potato plots with seaweed, wrack, shells, and sea-sand, all of which contain minerals that conduce directly to the healthy growth of the Potato.

3. Only on dry sandy soils should the dibber be used in planting Potatoes. The best mode of planting is to open shallow trenches with the spade or plough, and lay the seed therein at regular distances, to be covered about 4 inches deep only in the first instance. When the shaws first show the ground should be well worked between with fork, hoe, or plough, to keep down weeds and admit air into the body of the soil. In about three weeks afterwards they should be moulded up. It should be impressed upon all cultivators that to mould the plant overmuch is injurious. It is sufficient if the growing tubers are fairly covered; indeed, if a few are exposed, and become green in consequence, there is no loss entailed, for they can be saved for seed.

4. In planting on the poorest soils, a distance of at least 20 inches from row to row, and of 9 inches from seed to seed, should be allowed. Generally speaking, with land of average quality and sorts of average growth, a distance of 2 feet 6 inches between the rows, and of 1 foot between the seeds will be found the best. Sorts that are known to be rank in growth must have ample space allowed for the spreading of the shaws to the light and air, and with these a distance of 3 feet, or even 4 feet, between the rows will be requisite. So far as may be possible, planting on light dry lands should be completed during the month of March, and on heavy lands during the month of April. Good crops may be expected from seed planted in May if the work is well done, but the danger of delay in the planting is that the increasing warmth of the season compels the seed to sprout unduly, and thus leads to a waste of energy. Every detail of Potato culture should have in view to conserve the original vigour of the plant.

5. The sorts specially recommended for general culture on heavy soils, and for districts where the rainfall is considerable, are Scotch Champion, Red-skin Flourball, Magnum Bonum, Irish Cup, Perthshire Red, and White Rock. The sorts specially recommended for light land and for districts that have a moderate rainfall are Early Rose, Late Rose, Beauty of Hebron, Manhattan, Victoria, Grampian, Skerry Blue. All those recommended for heavy land may be planted on light land, but those recommended for light land should not be planted on heavy land.

6. The practice of planting small refuse seed has contributed in a most material degree to the deterioration of the Potato, not only in Ireland but throughout Europe. Any seed tuber weighing less than an ounce and a half is unfit for planting, and it is to be preferred that tubers averaging 2 to 4 ounces should be selected. Seed that has sprouted but little or not at all is to be preferred to that which has made much growth in store.

7. The proper cultivation and improvement of the Potato may be greatly promoted by means of competitive exhibitions, at which prizes should be awarded for the best samples, true to name, presented in a clean and attractive manner. In the schedules of all agricultural and horticultural exhibitions classes should be provided for Potatoes, with a view to quicken inquiry and promote a permanent interest in the rational treatment of the plant and the selection of the most useful varieties for particular soils and climates.

8. The so-called lazy-bed system of Potato growing should be discouraged except in cases where proximity to towns ensures a ready and profitable market for early crops of small-growing sorts of high quality. The robust habited kinds, on which alone dependence should be placed for main crops in agricultural districts, are scarcely amenable to the system, which necessitates close planting and tends directly to degeneracy of the stock.

The committee of the International Potato Exhibition will at all times gladly advise as opportunity may occur and as circumstances may suggest, and are prepared to comply with any requests that may be made to them by the Local Government Board, Dublin, so far as lies in their power in respect of Potato culture.—I have the honour, &c.,

J. A. MCKENZIE, *Secretary.*

Tower Chambers, Moorgate Street, London, E.C.

### HALLEY'S MOUNT, ST. HELENA.

WE are indebted to Captain S. P. Oliver for the loan of the sketch from which Mr. W. G. Smith has prepared the illustration (fig. 71) given on p. 401, of a most interesting view in the valley between Stitches' Ridge and Halley's Mount, in the historically interesting Island of St. Helena. The view was taken under the western side of Halley's Mount, and has Mount Actæon in the background.

In this valley is found abundantly the (so-called by the natives) Shee Cabbage-tree; the *Lachanodes prenanthiflora* of Dr. Burchell, the *Mikania arborea* of Dr. Roxburgh, or *Solidago Leucadendron* of Willdenow (see Hooker's *Icones Plantarum*, 1054). This plant grows to a height of from 12 to 15 feet, and its large broad handsome leaves have their midribs and veins of a deep crimson and purple, not unlike those of the Chilean Beet. The whole plant presents the appearance of a Broddingnagian Brussels Sprout, the leafy crown giving a good effect; and growing as it does among masses of *Polypodium* and *Nephradium*, its brilliantly coloured stalks show out brightly. Its drooping blossoms, which appear in June, are insignificant with its congener *Pladaroxylon*. The stiff upright stalks of *Lachanodes* contrast well with the general gnarled bushes and drooping Ferns associated with it. In the bed of all these mountain torrents are Weeping Willows (*Salix babylonica*). The stream here is perennial, and flows down to join the run in the James' Town Valley.

It is on the mountainous spur to the west of this valley, and but 100 feet or so higher up (on the left of this view) that it is proposed to erect a monument to the great Dr. Halley, after whom the mountain is named. For further details on this interesting subject we cannot do better than quote the following extracts from a letter of Captain Oliver's, published in the current number of *The Observatory*\*, and embodying some remarks from the work on the Island of Ascension, by Mr. Gill, of which it was our pleasant duty to speak in very favourable terms in our number for December 14, 1878, p. 754:—

"David strolled along to Halley's Mount, to search for the site of the observatory where Halley, in 1677, made his catalogue of southern stars and observed the transit of Mercury. We did not know whether any record of this work remained in stone and lime; and it was a pleasant surprise to find on the spot that an astronomer's eye at once picked out as the most favourable a bit of low wall, duly oriented, and overrun with wild Pepper (*Cluytia pulchella*). This had been the observatory without doubt; and near to it is a quarry from which the stones for its erection had evidently been taken. So charmed was my husband with this interesting record of the work of 200 years ago, that his investigations and surmises regarding it left us short time to linger in the little hollow lying near the foot of Halley's Mount."

"Then and there the present astronomer at Cape Town expressed to Captain Oliver, who was with him, his desire of seeing this neglected site recognised by some memorial, however humble; and there is now

\* *The Observatory*, a Monthly Review of Astronomy, published by Taylor & Francis.

reason to hope that the subject will be ventilated and soon assume a tangible form. A simple monument will best suit the subject and the locality to mark the very spot of Halley's observations; but a more practical monument, and one really needed, would be the re-establishment of Johnson's observatory, whose desecration Mrs. Gill patetically laments.

"To scientific readers," continues Captain Oliver, "the name of Halley needs no recommendation, although to the modern public we fear the name conveys but misty and vague recollections as nebulous as cometary emanations. The list of his scientific achievements yields to few in rank and importance. His transit method for obtaining the solar parallax, his prediction of the periodic comet, and the discovery of the acceleration of the moon's mean motion would alone entitle him to a proud position among our scientific worthies, without counting his laborious service to the state by his improvement of the method for obtaining the longitude and calculation of the Lunar tables, his tide observations and cartography of the Channel coasts, and, lastly, his optical investigations. We do not often think of him as a sailor; and yet, previous to Cook, Capt. E. Halley was our first scientific voyager and the constructor of the famous magnetic chart with the isogonous curves of variation, better known as the 'Hallean lines;' whilst, not least, the friend and coadjutor of Isaac Newton, it was owing to his energetic zeal that the first edition of the *Principia* was published in 1687."

"No more ardent admirer of Halley exists than Hudson Ralph Janisch, C.M.G., F.R.A.S.; and under such an administrator of the government it is fit that the monument should be raised in the island.

"As may be imagined, in such an insular position, in the heart of the southern trades, and right in the homeward track of the Australian and East Indian shipping, the time-ball and clock are most important items in the economy of a colony dependent upon ocean-going vessels for its existence; and to the credit of the Governor be it said that he personally regulates both by astronomical observation. It is an inexplicable anomaly that His Excellency should have to content himself with a home-constructed amateur observing station in the recess of a deep ravine, whilst 600 feet above it is a scientifically constructed observatory commanding an extensive horizon, solely used as a smoking symposium."

### DESIGN FOR FLOWER-BED.

THE productions of the garden excite pleasurable emotions, according as the efforts of the gardener to produce a pleasing picture are fairly appreciated, or the beauties of the plants grown in them are intelligently perceived. It is true there are persons endowed with insight and acknowledged good taste, who hold the designing and arranging of gardens in contempt, but much as has been said and written, rightly and wrongly, against the work of the designer, there has certainly been very little accomplished, particularly in the case of formal gardens, towards the improvement of this art. The oft-quoted lines of Pope are as applicable as ever:—

"Grove nods at grove, each alley has a brother,  
And half the platform just reflects the other."

The faults which in a general way our present flower-bed arrangements impress upon the observer are those of imitation, limitation, repetition, disunion in the parts. They show a patchwork-like bareness, or a useless floridity. The objectionable characteristics may well be avoided, not, however, by destroying summer effects as is sometimes proposed, but by giving proper scope for the introduction of hardy plants, and arranging the whole so as to yield progressive and ever-fresh impressions.

I herewith send you a diagram (fig. 70) illustrating some of the principles, which I arrived at some years ago, for the designing of flower-beds. Simple as the figure may appear to be, it shows a way in which the above-named faults can be avoided. The first glance will perhaps recall the idea of carpet-bedding, but the design in question is entirely different in its aim; for whilst carpet-beds depend upon the arrangement of technical lines, the effects or impressions to be realised by the principle illustrated by this diagram will or ought to depend upon light and shade. It shows a way by which to retain space for summer flowers, &c., and also of making these bedding designs permanently effective by the use of hardy plants. Instead of the usual poor patches of useless lines, in union neither with the surrounding buildings nor with Nature, it shows a principle of arrangement consonant with the teachings of Nature and the principles of Art, and demonstrates how a diversity can be developed by securing a proper proportion of light and shade in the landscape effect to be brought out.

Let me now endeavour to explain the diagram. A. shows the coffin-shaped bed so frequently kept before our view in laying out grounds, in order, I presume, to enhance our conception of the beautiful. This style should be avoided. B. shows what I take

FIG. 70.—DESIGN FOR A BED OF FLOWERS YIELDING SPRING AND SUMMER EFFECTS.

to be an illustration of the proper style of disposition of a similar site in order to secure variety—not, indeed, its full development, for the question would require more space than can now be devoted to the subject. C. shows one example of the manner in which the details of B. can be worked out. The outer figure is intended to be planted with hardy plants, giving a continual succession of special effects, and these are meant to occupy the ground permanently in the position indicated, the whole thus securing a perpetual picture of beauty. In planting, this list might be much extended, but my intention has been rather to suggest the idea than to work out the subject. In practice I find it difficult to get a sufficient variety of suitable plants to arrange gardens on this principle. The central circles show the spaces retained principally for the accommodation of summer bedding plants.

I have devoted much study to the question of design as applied to the laying out of gardens, starting from the designs generally adopted in formal gardening, and passing on to others that are not yet in use. These latter show how a plot of ground, from a few feet to 30 acres in extent, may be tastefully arranged. I contend that forms may be designed adapted for various places, and fitting in with diverse characters of style, and that these may be worked out so as to supply the wants of different situations without incurring the faults already named. These designs I shall be glad to show to any person—should there be any such—who may be able and willing to do justice to this question.

Outlines govern all things; therefore let the outlines be diversified according to the situation to be occupied and the character to be developed, in such degree, and to such a proportion, as will serve to embellish the landscape by furnishing it with suitable and carefully arranged trees and shrubs. *J. Forsyth Johnson, Landscape Gardener, Oak Lane, Wilmslow.*

The whole outer space to be carpeted with *Antennaria dioica*, margined with *Aubrietia deltoidea*, the various spring flowers and other plants being dotted over the space as marked by figures. The three enclosed inner spaces to be filled out with summer flowers.

Foreign Correspondence.

SETTLEMENTS ON THE STRAITS OF MALACCA.—The Malayan peninsula is comparatively unknown to Europeans, and it may not be uninteresting to make a few remarks as to the nature of the country and its inhabitants. The only districts in which any attempt has been made to turn to account the productiveness of the soil are the British possessions, generally known as the Straits Settlements, consisting of the islands of Pulo Penang and Singapore, and Province Wellesley and Malacca on the mainland.

At the north-western end of the Strait the British settlement of Penang keeps watch and ward, whilst at the south-eastern extremity our settlement of Singapore performs the duty of a British sentinel, in addition to its commercial operations. Between these two, 250 miles from Penang and 100 miles from Singapore, is the neglected but important settlement of Malacca itself, from which the Strait takes its name. These three (together with Province Wellesley, which appertains to Penang) comprise the British possessions on the Straits of Malacca.

We now turn to the settlements on the Straits of Malacca, which belong to Great Britain. These comprise, as I have already said, Singapore, Penang, and Malacca. Singapore, although the youngest, is the most flourishing and most important of the three; it was obtained by purchase from the Sultan of Johore in 1819. Penang next claims our attention. The Island of Penang is called by the Malays Pulu Penang (betel-nut Island), and lies about 3 miles from the mainland, which at this particular place bears the name of Province Wellesley. It is situated at the north-west entrance of the Straits, in latitude 5° 25' north, and longitude 100° 21' east, and is about

14 miles long by 10 broad, containing about 75,000 acres. It is very hilly, the highest range being 2500 feet above the sea, affording to the inhabitants a charming retreat and a delightful climate, the temperature averaging not more than 72° Fahr. On the lower hills, of course, the average is somewhat higher, although still temperate. The rainfall is about 50 per cent. more than on the plains below, and all the hills are clothed with an abundant and constant vegetation. Government has a house on the hill, and there is also a convalescent bungalow for invalids. The British acquired this island by purchase from the Sultan of Quedah, and in a similar manner they obtained, in 1800, a strip of land of about 20 miles along the opposite shore of the peninsula, which they named Province Wellesley. This strip originally comprised about 25,000 acres of land only, but a small portion lying back from the shore has since been added to it. I wish particularly to point out the present state of Province Wellesley, which was, comparatively speaking, only a few years ago a Mangrove jungle teeming with pirates. Although the original pioneers of civilisation in the province are not yet dead, what is its position now? The greater part of it is in a state of high cultivation. This little patch of land, of about 300 square miles in extent, now contains almost as many people as there are in Perak, which is thirty times as large. It possesses nine large sugar estates, most of them fitted up, regardless of expense, with the most modern appliances, and valued at from 150,000 dols. to 300,000 dols. each. It has also two large Tapioca estates, and one of Tea, all of which employ about 20,000 imported labourers, irrespective of those engaged in the cultivation of sugar on a smaller scale, Paddy, Cocoa-nuts, and Betel-nuts, and other produce. The annual value of its products cannot fall short of 2,500,000 dols., being one-third of that of the exports of Jamaica, one of the most celebrated of the West Indian Islands, which contains some 4000 square miles, and 500,000 inhabitants. It is almost one continuous garden, and nothing like, or even approaching to it, is to be found between the coast of Tenasserim, except in that well-governed Malay State, Quedah.

This prosperous state of Province Wellesley shows what can be done by agriculture in the Malay States under British protection: and if so much can be done in so small a place what may be reasonably expected from the Malay States of Perak and Salangore, with their 20,000 square acres of virgin soil? The rivers of the Malay States are navigable for over 100 miles into the interior, so that facility exists for bringing down produce, all of which, from Klang northwards, would probably find its way to Penang.

I am confident that the Malay peninsula is destined at some future day to become the garden of the world, for it is the only country, Sumatra excepted, in which a state of perpetual summer exists, where the vegetation is always green, and where the climate is so healthy that a European can work in safety. The nine months' droughts, heavy floods, and the yellow fever, so fatal elsewhere, are unknown in these places.

Province Wellesley is irrigated by five rivers, the majority being of considerable volume, viz, the Muda, Prye, Jooroo, Jungjong, and Kreean. On the banks of the Prye and the Muda, and in some other particular localities, the soil is richer and of a more enduring character.

The banks on the Province Wellesley, or southern side, are lower than on the Quedah or northern side. Quedah is a native Malay State, tributary to the King of Siam. If it were not for the bund or embankment the whole of the province would be overflowed during the rainy season. The river rises to a great height when there are very high tides, and inundates the land lying on the British side up to the foot of the bund. I had occasion to ride along the top of the bund in company with a Government surveying party; starting from Buggan Birtam one fine morning, we came to a small Malay village, by name Buggan Ecan Mattee, which means in English "the place of the dead fish;" it is very swampy thereabouts. There is a police-station there, which is the most northern in Province Wellesley. After leaving this small village, on turning a corner of the grass-covered road, we came upon a Malay campong, or native habitation, situated on one side, and on the other were paddy or Rice fields stretching out as far as the eye could see; not long afterwards the bund was reached.

The first view I obtained of the Muda was lovely;

our party had to ride in Indian file, owing to the bund being very narrow on the top—only a foot wide in some places. While riding along, the winding river frequently came into view after deviating from a straight course, and being frequently lost to sight. In some places on the Quedah shore the banks are covered with dense impenetrable jungle to the very water's edge; in other places there are broad strips of land apparently covered with rich pasturage suitable for cattle to graze upon. This neighbourhood is much frequented by the native traders in search of cattle, which here are to be acquired at a cheaper figure than elsewhere. To the best of my belief this is owing to the fertile properties of the soil, which are not at all opened up—a remark which may apply to the whole peninsula more or less. The whole country is comparatively neglected, as those in search of wealth have hitherto either gone to India, or pass it by unobserved on their way to China, and there are few who are able to give much information of the mineral and agricultural capabilities of the Malay peninsula to possible speculators.

At various times, as we rode along the bund, glimpses were caught of the Malay hamlets in the turns of the river. These hamlets, or lake dwellings, which constitute the ordinary habitation of the Malays, are built on four poles supporting the house, or Attap leaf-head; they exist among the Malays as the easiest way to protect them against wild beasts. Sleeping a night at Samataul, I was poled across the Muda in a native boat accompanied by the Government surveyor into Quedah. Landing we passed through thick jungle till we came to a place cleared in the dense foliage, where we had a few shots at some white birds with large beaks, but were unsuccessful in bringing any to the ground.

A quarter of an hour's brisk walking over fallen trees brought us to the top of the mountain my friend was going to survey, having previously got permission from his Highness the Sultan of Quedah. About half an hour's hard climbing landed us on the top, when, panting and breathless, we stopped to look around us and admire the scenery—the Muda, like a peaceful dream, lying at our feet. From the banks of the Muda, on the British side, to Bukit Martajam (bukit means hill in Malay), about 15 miles off, the land is flat, and most of this is cultivated by the Malays in paddy or Rice, interspersed here and there with Cocoa-nut and Betel-nut trees. The kingdom of Quedah seems a succession of forests and hills. The Sultan testifies great intelligence, and wishes to introduce European improvements. On a later visit to Quedah I had occasion to notice beautiful roads and a dock where he is having some yachts built by a European engineer; this was at Allah Styah, the capital. The road from Allah Styah to Anah Bukit, the residence of the Sultan's third brother, Tunkkoo Vaccoop, is a fine broad road, past the Rajah's palace. The Tunkkoo's house (Tunkkoo means in Malay a prince) is embosomed in Orange groves; he is a young man of about twenty-seven or twenty-eight, and dresses like a European.

Having feasted our eyes on the surrounding country from our elevated position, we retraced our steps, and arrived at Samataul about 3 o'clock, and getting on our ponies found ourselves in due course at our journey's end.

The two staple articles of Province Wellesley are Sugar and Rice. The Malays have almost a religious regard for the Rice plant, and the Malay of Province Wellesley would as soon think of parting with his family as of voluntarily disposing of it to another. Sugar has formed a most productive source of prosperity in the Straits, and there is no doubt it will continue to do so. The planters in the Province Wellesley are at present unable, from limited means, to extend its production as much as the capabilities of the settlement will admit of. In the native states Europeans are hindered from opening plantations from the fear of the lawless rule of the native petty rajahs, and the consequent peril to the lives of Europeans, as there are no police or any of the other concomitants of a civilised and well ordered country—the will of the rajah is law (whether it be equitable or wholly unjust) within his own dominions; but the maintenance of order is carried out with so loose a tenure that the native princes have a very uncertain rule. *A. T. Sibbald.*

**HUMANE VERMIN-TRAPS.**—We (*Worcester Herald*) understand that a subscription has been raised for the purpose of awarding one, two, or three prizes for the best design of a humane trap, or painless method of taking rabbits and vermin, the prizes to be awarded at the meeting of the Bath and West of England Agricultural Society at Worcester next June.

## Garden Operations.

### KITCHEN GARDEN.

**SEKALE.**—This plant, which by a certain process of cultivation yields such a delicacy each season, is eminently one of those which is easy to propagate, and requires but a plain course of treatment in cultivation, and, moreover, it can be increased with such marvellous rapidity that if a stock of it is once obtained it can easily be maintained or augmented to almost any extent, either by means of seedling plants or by the more popular method of cuttings made from the roots; these are procured at the time the plants are lifted for forcing or other purposes, when for the sake of convenience in planting, they are taken off. If the best of these are selected and made into cuttings every year, and are planted in addition to the stock which has been forced, an adequate supply of plants to meet the ordinary demands in this way may be secured without any trouble or difficulty; and if for special requirements more are needed, then recourse can be had to the smaller roots for the same purpose. Cuttings are formed out of the roots with the thickest pieces 3 or 4 inches long, and prepared simply by cutting off the top horizontally and the bottom obliquely to distinguish it. After the operation lay them in soil which is moderately dry until the plants become callused over, when they will be fit for planting. This operation should not in our opinion be proceeded with before the middle of March; the subsequent treatment will consist of mere ordinary attention, as the keeping of the soil about the plants free from weeds, to stirring it occasionally, and to limiting the breaks which issue from the plants to single growths on each; and for the purpose of obtaining fine growth and large well formed crowns manure the ground every year, and apply a slight sprinkling of salt and soot over the whole surface when the leaves have performed their office and are fit to be cleared away altogether. The plants, by reason of the force of vitality and powers of endurance which they possess, will grow almost anywhere, though the conditions be most obdurate; but to make the plants reach the highest standard in cultivation, and prepared to produce Kale in like manner, a deep and rich soil is indispensable, and if this partakes of a gritty nature it comes nearest to the natural requirements of the plant in question. Where the soil is not congenial it can be materially ameliorated and assimilated by the introduction of roadside scrapings. This is a compost of the utmost value and importance wherever the land is tenacious and heavy, and can be bought in the vicinity of most places at about 1s. a load; its value in many ways for cultural purposes is also such that a stock of it should be always kept on hand in readiness for use. To raise plants from seed let it be sown in March, in drills 2 inches deep, very thinly, and 18 inches asunder. To make plants the cuttings should be dibbled in from 9 to 12 inches apart in the rows, and about 18 inches between them. In digging and planting ground simultaneously a perpendicular trench should be cut down as the work proceeds, and the sets be placed and firmly embedded against it, keeping the top of the plants even with the surface of the ground.

**FORCING.**—This differs materially at various places both in the way of means and application; it can, however, be successfully accomplished in almost any place where a temperature of from 50° to 60° can be assured; at many places the Mushroom-house is the place which is chosen, or corners in close proximity to heating appliances are sometimes utilised; while the old plan of having pots surrounded with leaves, &c., is not yet entirely out of date. We practise a modified form of the latter process, because we are quite convinced that it cannot, if forced, be obtained in that tender state which makes it so palatable except by the assistance of heat which is produced from properly sweetened fermenting materials. We, therefore, as early as possible in the autumn make a point of collecting and carting to a fixed place in the frame-ground a quantity of leaves, and mixing an equal portion of long stable manure with them; a square mass is then formed about 5 yards over and about 2 yards high. This are trodden down moderately. When the heat is generated, and the time to commence forcing has arrived, we form a central space in it by taking out the material and leaving, as it were, a wall 3 feet thick all round. A wood frame is then placed on the side walls of leaves which is covered with boards at the top, over which 2 or more feet of the stuff removed is replaced. An entrance is made on one side and a door fitted to it, in order to be able to attend to the necessary operations, and for a medium of ventilation should it be requisite; at other times it is covered in altogether. The sets are planted on the floor within this place in prepared light and rich soil, and introduced as occasion requires. By these means and this inexpensive contrivance we get an adequate supply of Sekale to meet our demands, of the best description and with but little trouble after the commencement.

To have a regular supply of Seakale in the best condition, which is when it is about 3 or 4 inches long, necessitates frequent attention to the introduction of plants for successional supplies, and unless this matter is properly seen to it will at times become attenuated, and not nearly so good in point of quality. Very late supplies of it are not so much in demand. If they are wanted for private requirements no plan with which I am acquainted excels the use of pots being placed over the crown, and these covered with some kind of stuff which will prevent air from penetrating inside them: in this case the pots should be on before growth commences. Any surplus plants which may not have been required should have the tops cut off, as by so doing better crowns for the subsequent year will be the result.

**GENERAL WORK.**—No complaint can reasonably be made about the weather which has of late prevailed; it has been all that can be desired for the purpose of advancing those operations which are of moment at this particular season, such as sowing seeds, planting out crops, and for promoting the destruction of the myriads of weeds which are just now coming through the soil.

**FRAME GROUND.**—The different subjects in cold frames, as Lettuces, Radishes, Carrots, &c., will need careful airings during the existence of cold easterly winds. Stanstead Winter Cabbage Lettuce is an excellent kind for this sort of work. We at the present time have a frame full of it coming in. Wood's Early Frame Radish is undoubtedly the best in its way, taking all points into consideration. Parsley in frames should be closed altogether excepting when very sunny, because at this time the advantage of cultivating it in this way is visible. Newly pricked-out plants of Brussels Sprouts, Celery, &c., should be kept rather close until they have taken hold of the soil. *Geo. Thos. Miles, Wycombe Abbey.*

#### FRUIT HOUSES.

**PEACHES AND NECTARINES.**—When the young shoots in the early house have been neatly heeled-in with a tie close to the base, and the superfluous growths entirely removed or pinched back to form spurs, the trees should be allowed to make free growth until they are sufficiently advanced for the general tying down to the trellis. If any of the shoots show an inclination to become too strong, pinch out the points before they have time to derange the balance of the trees. Proceed with the thinning of the fruit—an operation which must be regulated by the strength of the trees, always bearing in mind that a liberal percentage must be left for removal after the stoning period. Where size and quality are first considerations, one Peach to every square foot of trellis covered with foliage will be found a heavy crop, and any number taken in excess will affect the weight of each fruit and shorten the lives of the trees. Under the influence of winds and sunshine the trees will require good syringing with tepid soft water twice a day, and if not already done the surface-roots should be mulched with short manure and well watered—the first time with pure water, and afterwards with tepid liquid manure. Shut off fire-heat early on fine mornings, and at the same time take off night air. Aim at a steady minimum temperature of 60° with a rise of 10° to 15° by day until after the fruit is stoned, when the trees will stand sharper forcing if it is found necessary. Disbud the trees in succession-houses and pinch for spurs or entirely cut away all shoots that are not likely to be wanted for the support of the present or the production of the next year's crop of fruit. Commence at the extremities of the trees, and work gradually down to the base. Thin away all small or badly placed fruit as soon as the most promising for the crop can be decided upon. Syringe, water, and ventilate in accordance with directions for the early house, and allow the temperature to range a few degrees lower. The unfavourable condition of trees on open walls will point to the advisability of retarding late houses for giving the autumn supply. At the present time one of our late houses is in flower and another containing trained and pot trees will be ten days later: the latter, in the event of the summer proving warm and bright, will be placed in a sheltered position out-of-doors to ripen their fruit, and after it is gathered they will be taken back to the house to ripen their wood. For culture in late houses such free setting kinds as Bellegarde and Barrington should be planted. Royal George is a general favourite, but being subject to mildew the houses in which it is grown should be well ventilated and fitted with hot-water pipes. *W. Coleman, Eastnor.*

#### ORCHARD-HOUSE.

At the time of writing this the trees are fully in blossom, and the weather is very favourable for a good set—clear cold east winds, with the thermometer seldom falling below 35° at night. It is just as well to gently shake the trees every day about 1 o'clock in the afternoon. There is no need to apply any artificial heat under such circumstances as the present. In applying water to the roots of the

trees see that none is spilled on the paths or borders, a dry atmosphere is best; there is such a thing as an over-dry state of the atmosphere, but this is not possible so early in the season as this is, and in an unheated house. Air the house freely when the sun is shining by day, even if it is cold. The trees in the house that has had artificial heat applied will now be growing freely, the young growths nearest the top of the trees should be stopped at the fourth or fifth leaf; if those lower down are weakly, this will throw more vigour into them. When trees are very vigorous it is not necessary to be so cautious: they may be stopped all over the trees at the same time. It is quite necessary to stop these growths, especially if they are very strong; such shoots if left to themselves would give very unsatisfactory results: when they are stopped three or four slender growths are produced, which will probably be studded with blossom-buds. The night temperature of the house may now be maintained at 60°. Syringe twice daily during fine weather, in the morning only should it be dull and wet. Where Strawberry plants on the shelves have their fruit set, it is a good plan to support it on twigs: the end to be inserted in the soil, and the fruit to hang over the clefts of the twigs. Apply weak manure-water at every alternate application. *J. Douglas, Loxford.*

#### THE CHERRY-HOUSE.

These trees are peculiarly liable to the attack of both black and green fly, and their presence is usually indicated by the curling up of the leaves. If either of these pests should abound on the trees here it should be attended to at once. The remedy which we use and recommend for the purpose of exterminating the pest, and for making the leaves of the trees as nauseous and obnoxious as possible, is Quassia chips. These are employed at the rate of 6 oz. to a gallon of cold water, which after it is made is allowed to stand about twenty-four hours; and in order that the liquid may pass through the syringe freely and without giving much trouble, the chips are enclosed in a bag and submerged. It should be applied by means of a fine syringe at any time when there is no danger of it being washed off, and the applications should be discontinued altogether when the fruit is about half-grown until such time as it is gone, when, if necessary, it can be used again. Another pest, in the shape of a grub, will also be troublesome at times at this period, the whereabouts of which will be observed from the same cause as before noted. These can only be got rid of by means of hand-picking—a very tedious process, but nevertheless effectual. Growth in the trees and fruit likewise is now proceeding rapidly; ply the syringe over the trees every day in the morning, and again early in the afternoon on sunny days. A comparatively low night temperature is best. Ventilate the house at about 58°, and close it for the day at about 60°; under genial conditions open the front sashes, and let the full force of the air operate on the trees. To help to swell up the Cherries satisfactorily a little stimulating agent may be applied; we always use guano in a diluted form. All growths excepting the terminal ones and those placed where fresh ones are wanted should be pinched-in to about the sixth joint, others should be heeled-in at the base and tied-in when they require it. *G. T. Miles, Wycombe Abbey.*

#### PLANT HOUSES.

**ORCHIDS.**—Under the influence of the brilliant weather we are now getting, these plants will be fast recovering from the effects of the late dreadful winter. One of the very best signs is the development of new roots, after which naturally follows a green healthy look in the foliage. So wretched was the weather last autumn that such Cattleyas as *C. Trianae* failed to make anything like their usual number of roots from the flowering bulb; the consequence being that the flowers of such have been wanting both in quality and quantity. I now see with pleasure that the said bulbs are pushing many roots, which promise well for robust growth. Such plants might, if they need more root-room, be safely potted, as the young roots will speedily establish themselves in the fresh compost. The following plants, which are now breaking and whose young breaks emit many young roots, should also be top-dressed or potted:—*Cattleya exoniensis*, *C. labiata* (autumn flowering), *C. Leopoldi*, *C. amethystoglossa*, *C. Harrisoni*, *Laelia elegans*, and its many varieties. The compost for these should consist of two-thirds of the best fibry peat and one third of sphagnum. Keep the plants well elevated and use enough stakes to hold them firmly in their places. Pot moderately firm, but avoid that hardness which prevents the water from passing rapidly away. The pots for these plants should be at least two-thirds full of drainage, secured by a layer of fresh sphagnum. After these plants have been potted, keep them rather dry at the roots in a moist, shady part of the Cattleya-house. The Australian *Dendrobium superbiens* will now be starting into growth, and will also require potting. In this respect and in all others,

with the exception of water, it may be treated the same as the Cattleyas. Water must be given to it liberally and frequently, or sound sturdy growth need not be expected. *D. speciosum* and *D. Hillii*, the former of which will be now flowering, must be generously treated till they have finished up their growth. When resting through the winter they both require to be kept cool and dry, but whilst growing they delight in a hot, airy, moist atmosphere, with abundance of light. Many of the following *Dendrobiums* will be passing out of flower:—*D. nobile*, *D. Ainsworthii*, *D. Wardianum*, *D. crassinode*, *D. Boxalli*, *D. primuminum*, *D. cucullatum*, *D. Findleyanum*, *D. cretaceum*, *D. moniliforme*, *D. lituiflorum*, and *D. capillipes*. Where plants of the above species want more root-room, let them be at once seen to, and afterwards placed in their growing quarters. Either will grow perfectly well suspended in a teak basket near to the roof of the *Dendrobium*-house. An inch or two in thickness of fibry peat and sphagnum will suit their roots. For the next few weeks keep them rather on the dry side, but so soon as the young breaks send forth roots water more frequently. Such strong, erect growers as *nobile* do thoroughly well in pots provided they have a well-drained, open compost to root in. Avoid getting the young breaks filled up with water, and sponge the foliage often enough to keep it clear from red-spider or thrips. The raceme flowering section of *Dendrobiums* will now be pushing out their flower-buds, and in order to properly develop such the plants must receive more water at the roots, and a warmer atmosphere than their resting quarters. This section contains such fine Orchids as *D. thyrsoiflorum*, *D. densiflorum*, *D. Schroderi*, *D. Griffithianum*, *D. fimbriatum*, *D. Farmeri*, *D. suavissimum*, &c. The tall-growing *D. moschatum* and *D. Dalhousianum* are also of this section, but as they flower later they may still be kept for a week or two on the resting system. Whatever is needed by these plants, in the way of pruning and staking, should be done at once; as it is difficult to do so without injury when the flower-spikes are far advanced. In pruning, cut nothing away that is not dead, for the bulbs of these *Dendrobiums* continue to throw flower for some years, even if they are leafless. Now that the hours of daylight are increasing the temperature in every division should be allowed to rise a few degrees. During the hours of darkness the cool-house should not sink for any length of time below 55°. Through the day ventilate freely whenever the external air is rising above 40°, and shade if the sun is powerful enough to carry the inside temperature above 65°. On dull cold days maintain a day temperature of 60°. The night temperature of the Cattleya, Mexican, and intermediate houses should not fall below 60°, and the day temperature must rise from 5° to 10° above this. Ventilate by the bottom ventilators when the external air is rising above 45°: they should be wide open at 55°. The East Indian-house temperatures should be, night, 67°, day, 73°, as maintained by fire-heat; a rise of several degrees more by sun-heat will do good. Ventilate through the middle hours of the day only, say from 11 till 3 o'clock. Give the *Dendrobium*-house a trifle less heat and more air. In all these houses shade only when the sun is clear and strong. *J. C. Spyers, Burford Lodge, Dorling.*

#### TOWN GARDENING.

**EDGING PLANTS.**—About the first week in April, if the weather is favourable, all hardy edging plants of flower-beds and borders should be planted. Amongst some of the best I may mention:—*Cerastium tomentosum*, *Veronica incana*, *Antennaria tomentosa*, *A. plantaginea*, *Santolina incana*, *S. lavandulefolia*, *Dactylis glomerata elegantissima*, *Cineraria maritima*, *Sedum glaucum*, *Stellaria graminea aurea*, *Thymus aureus variegatus*, *Achillea aureum*, *Sedum acre*, *Sempervivum californicum* (calcareum), *S. tectorum*, *S. montanum*, &c.

**PLANTS FOR MASSING.**—Plants suitable for planting in groups or massing in single beds will be found amongst the following:—*Brugmansia Knightii*, *Cannas* of sorts, *Cassia corymbosa*, *Cineraria plataniifolia*, *C. acerifolia*, *Erythrina* of sorts, *Eucalyptus globosus*, *Ferdinandia eminens*, *Ficus elastica*, *Grevillea robusta*, *Melanthus major*, *Monstera deliciosa*, *Nerium giganteum*, *Polymnia grandis*, *Sonchus laciniatus*, *S. pinnatus*, *Ricinus* of sorts, *Solanum macrophyllum*, *S. verbascifolium*, *S. Warszewiczii*, *S. robustum*, *S. marginatum*, *Sparmannia africana*, *Verbesina gigantea*, *Wigandia caracasana*, and *W. Vigieri*.

**CALCEOLARIAS.**—A temporary frame should now be made for the reception of the autumn-struck *Calceolarias*, with 3 inches of well-decayed stable litter at bottom, and on this 4 inches of loam and leaf-mould. By the time the *Calceolarias* are required for planting in their summer quarters the litter will be found to be one mass of roots. *William Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Mar. 31	}	Sale of the whole of the Specimen, Exhibition, and other Plants, at E. TIGHE'S, Esq., Pittville, Cheltenham, by Protheroe & Morris (two days).
THURSDAY, April 1		

Sale of Roses, Shrubs, Carnations, Picotees, and other Plants, at the City Rooms, 33 and 35, Gracechurch Street, E.C., by Protheroe & Morris.

THE question of the applicability of the ELECTRIC LIGHT for FORCING PURPOSES may be considered as solved. To some gardeners it may seem a matter of little consequence whether or not the electric beam has the same power as the solar ray of so acting on the green matter of plants as to cause the breaking up of carbonic acid into its constituents and the evolution of the oxygen. That they would look on as a matter of scientific interest of little importance to them. Others better informed in the principles of their craft would not fail to recognise the vast importance of the matter. All alike would like to see practical demonstration of the potency of the light. It is all very well to talk of exhalation of oxygen, formation of starch, of sugar, of colouring matter, of oil, and the numerous substances met with in the tissues of a growing plant. It is interesting to learn how by interchange of gases, evaporation of water, and so forth, one substance is gradually converted into another, and so forth, as the plant is matured. But it is far more to the purpose, in the opinion of the practical gardener, to show the concrete result of all this in the shape of ripe fruits or richly coloured flowers. This has now been done.

At the meeting of the Royal Society on the 18th inst. Dr. SIEMENS showed two pots of Strawberries which had been treated in all ways alike, save in the circumstance that one had been submitted to the electric light for fourteen nights, while the other had not. The difference between the two plants was very marked. The plant which had been constantly exposed to light—solar by day, electric by night—had finer, more vigorous foliage of a deeper green than that which was grown in the ordinary way. The difference in the fruit was even more remarkable. The fruit on the plant subjected to the electric light was a week, or it might be ten days, in advance of the other. Of sixteen berries that we specially noted all but two were coloured, and most were ripe, only one or two were immature. On the plant which had not been subjected to the electric light we counted specially, for comparison sake, fourteen berries—one or two of which showed faint indications of beginning to colour, while the rest were all green, and as usual of various sizes; so that the electric light seemed to have had the effect, not only of hastening the ripening, but of ripening all the berries on a single truss nearly at the same time. If this result be obtained constantly, we need not say what a boon it would be to gardeners. But at present the experiments have been conducted on a comparatively small scale, and much remains to be done before the light can be generally employed; still, we look upon it as a certainty that it will be used extensively in the future, and that with very great gain in point of time especially, and time in forcing means money.

Various specimens were submitted to the several committees of the Royal Horticultural Society by Mr. BUCHANAN, Dr. SIEMENS' gardener, on the 23d; a notice of which will be found under the head of the "Scientific Committee" on another page of this issue.

Two questions remain for consideration—that of cost and that of rest. By an unfortunate oversight in our last number the word shillings at p. 363 was printed for pence. The actual cost at present is estimated at 4d. to 6d. per hour for a light equal to that of 1400 candles. Taking this as a rough estimate to be afterwards modified and probably reduced the gardener must bear in mind that his coal bill will be considerably reduced, not only because less time will be required for forcing, but because the light itself gives out a very considerable amount of heat. Again, where water-power can be employed in place of steam-power the cost would be very materially reduced.

Another question is that of rest. Practical gardeners and physiologists are alike of opinion that a regularly recurring period of rest is as essential to the welfare of the plant as it is to that of an animal. And the objection has been already raised that by the continuous exposure to light the plants will ultimately be killed. They will live like prodigals and spendthrifts, and share their fate in untimely death. But this argument is worth very little from the point of view of practical cultivation. The plants in high northern latitudes exposed to some weeks of continuous light live rapidly, produce flowers of surpassing brilliancy and perfume, and then hibernate till the next season. Do not gardeners heat their forced plants in exactly the same way? When their object is attained they no longer force, and the plant is allowed to go to rest. It does not follow, as the objectors appear to think, that because it may be desirable to use the electric light for a few days, or at most a few weeks, it will be necessary to use it always. Even if it were so, what is there to prevent a constant succession of recruits being grown on for forcing purposes to supply the places of those whose life may be spent in the process. As it is, few find it worth while to force their pot Vines a second season. The objection on the score of want of rest may then be dismissed as quite without force. We force the plant, not for its welfare, but for our use, and we take care to grow a sufficiency to compensate for any loss there may be.

— DENDROBIUM LITUIFLORUM.—A very remarkable specimen of this lovely Indian Dendrobium was shown the other day at Clifton, on the occasion of the Bristol Spring Show Society's exhibition. It was imported twelve months ago, is now growing in a 7-inch pot, and bore over 170 of its bright, fresh flowers—an admirable example of what can be done in a little time by good management with healthy imported plants. Great favourite as *Dendrobium nobile* has always been for general purposes, it is not unlikely that *D. lituiflorum* will become even more prized, on account of its extremely free-flowering habit and charmingly tinted flowers, which form a dense mass of delicate colour. We should add that the exhibitor was Mr. PERRY, gr. to H. C. MILES, Esq.

— PRESENTATION TO MR. BANNISTER.—After the dinner on the 17th inst., at which the committee of the Bristol Spring Show and Chrysanthemum Society entertained their friends and the judges, an incident occurred which gave evidence of the manner in which the committee appreciate the services rendered by their Chairman, Mr. BANNISTER, whom they presented with a handsome inlaid writing-desk, bearing an inscription which expresses their high estimation of the manner in which he has laboured for the welfare of the Society. When those who take an active part in the work incidental to the management of a Society like this mark their approval of those of their number who devote their time and attention to the object in view, it is the surest evidence of continued success.

— THE VEGETATIVE ORGANS OF ORCHIDACEAE.—Dr. PRYZER, the Professor of Botany in the University of Heidelberg, has arrived at Kew to pursue in the Jodrell Laboratory a research on the vegetative organs of Orchidaceae. During the past

winter the physiological room in the laboratory has been employed for Mr. PAGE's course of lectures on elementary physics and chemistry, which have been well attended by the young gardeners and others.

— DR. SCHEFFER.—We greatly regret to hear of the death, at the early age of thirty-five, of Dr. SCHEFFER, the able and courteous Director of the beautiful Botanic Garden at Buitenzorg, Java. Dr. SCHEFFER's death will be felt as a very serious loss to botany and horticulture.

— THE CENTRAL HORTICULTURAL SOCIETY OF FRANCE.—The annual show of the Société Centrale d'Horticulture de France will take place from June 5 to June 8 next. It will be held as usual in the Palais de l'Industrie, Champs Elysées, and in conjunction with the exhibition of pictures, sculpture, &c.

— BATH AND WEST OF ENGLAND SOCIETY.—This Society will meet this year at Worcester, and there is a good prospect of the horticultural department being well looked after by the indefatigable steward of that department, the Hon. and Rev. J. T. BOSCAWEN. Two cups will be given, one for the best collection of Orchids, and another for the best specimen Orchid.

— THE SAGO PALM.—The museum of the Royal Gardens, Kew, has obtained in exchange from the Botanical Department, British Museum, a fine stem of the Sago Palm (*Metroxylon laeve*). It has been erected in the Timber Museum (No. 3).

— EPPING FOREST: ELECTION OF VERDERERS.—At a meeting of the Common Council, held on the 18th inst., the Recorder (Sir T. CHAMBERS, M.P.) reported the result of the election of verderers of Epping Forest, pursuant to the Act of 1878. He stated that for the northern forest parishes, which returned two verderers, there were four candidates, and as Sir T. F. BUNTON and Mr. E. N. BUNTON headed the poll, they were therefore elected. For the southern parishes the two retiring verderers—Mr. ANDREW JOHNSTON and Sir ANTONIO BRADY—were re-elected. The verderers hold office for seven years from March 25.

— FORCING BY THE ELECTRIC LIGHT.—The following neat epigram on the use of the electric light for forcing purposes appeared in the pages of *Nature* last week:—

"Quis veterum vidit plantas sine sole virentes  
Germinat en semen Siemensi lumine claro."

— SEED POTATOS FOR IRELAND—Messrs. JAMES CARTER & Co., of High Holborn, have received an order to supply the Duchess of MARLBOROUGH's Irish Famine Fund with 1000 tons of Champion Potatos. Some idea of the magnitude of this order may be gained from the fact that it will amount to about 13,000 sacks.

— THE RELIEF OF IRISH FARMERS.—*The Irish Farmers' Gazette*, in urging the importance of not neglecting green crop cultivation under present circumstances, remarks:—"A better use could not be made this year of some of the many thousands of pounds sterling that are now, and must be, distributed amongst the bankrupt small farmers in the distressed districts than in purchasing seeds of Parsnip, Swedes, Mangels, and Dale's Hybrid Turnips: they all know well how to cultivate them. £1000 worth of such seeds would go farther than many thousands worth of Champion or other Potatos, which, after all, by the mysterious decrees of Providence, may be smitten in one night. We say in one night. Why? Because before our eyes a large sowing of Potato seed, saved from the Potato apple or plum, as some call it, in 1845, was destroyed in one night, though well protected; no near relative to or congener of the common Potato is safe from the Potato fungus, *Peronospora infestans*. In 1848 and 1849 we saw *Solanum sultanicum* seriously injured in leaf, stem, and root in the Trinity College Botanic Gardens by the same identical disease as that affecting the common Potato. Unfortunately, the farming classes gradually put faith in the Potato, year by year increasing the area under crop, notwithstanding the serious warnings received; for, although the disease has never

FIG. 71.—FREE FERNS AND SHEE-CABBAGE ON HALLEY'S MOUNT, ST. HELENA. (SEE P. 396.)

ceased to afflict the crop, the produce was so large that they said they could well afford the loss of 25 per cent., and so on, till a general destruction had fallen on some of the best varieties, except the Champion, although it has not escaped scatheless, so that it will be more than madness to depend wholly on that or any other variety till it is the pleasure of the Almighty Ruler of all to destroy the destroyer—the mysterious, the subtle, insidious *Petiospora infestans*."

— **SALE OF THE LATE MR. SERJEANT COX'S ORCHIDS.**—On the 17th, 18th, and 19th inst. the collection of Orchids formed by the late Mr. Serjeant Cox, at Moat Mount, Mill Hill, near Hendon, was brought to the hammer at Stevens' Rooms, and realised £1996 16s. 6d. There were 1245 lots, and the following are some of the prices obtained:—*Cypripedium Harrisianum*, 120s.; *Masdevallia ignea*, *M. peristeria*, and one other, 200s.; *Cattleya Trianae*, 180s.; *Vanda planclabris*, 100s.; *Phalenopsis Schilleriana*, 100s.; *Angraecum Ellisii* and *Phalenopsis rosea*, 110s.; *Odontoglossum vexillarium*, 273s. and 136s. 6d.; *Odontoglossum Hallii* and one other, 120s.; *O. triumphans*, 170s.; *O. Andersonianum*, 441s.; *O. pulchellum majus*, 150s.; *O. citrosimum roseum*, 210s.; *Masdevallia ignea*, 210s.; *M. Lindeni*, 220s.; *M. tovarensis*, 252s.; *Cypripedium Stonei*, 190s.; and *Ada aurantiaca*, 210s.

— **THE GENERAL HORTICULTURAL COMPANY (JOHN WILLS), LIMITED.**—Such is the title of a new company which has been established for the purpose of purchasing and developing the business of Mr. WILLS as a nurseryman and floral decorator. The company, which is to be conducted on co-operative principles, starts with an imposing array of lady patrons, directors, &c., and has taken extensive premises in Regent Street. In addition to the ordinary features of similar businesses, it is proposed that shareholders should dispose of the surplus produce of their gardens through the agency of the company, and so obviate the necessity for employing a middleman as salesman. It is proposed to have in the Regent Street premises a continuous display throughout the London season of floral and table decorations laid out in the newest and most *recherché* styles, and the lady patrons will be invited to inspect them and offer suggestions.

— **WHY TRUG?**—Mr. SHIRLEY HIBBERD writes "When I sent the note on the useful Sussex basket (p. 373) I asked myself, Why Trug? And the only answer I could discover was, because it rhymes with thug, bug, rug, and mug. The Sussex Trugg (according to NATHAN BAILEY, who is not always to be trusted) covers a milk-pail, a hod of mortar, and two bushels of anything. In the larger, and therefore best local sense, trug is an obsolete and ugly word derivable from 'trieg-en,' to deceive. From this same root we have truck, the equivalent of dray and drag, a thing intended for carriage of goods, whether with or without wheels; for some carriages are sleighs, and run upon runners. And the modification gives us track, the route of the carriage whatever it may be, whether bridge-path, wheel-rut, or railway. But track may apply to the goods carried, and the mode of carriage; hence we speak of a British track-way, without any suspicion of impropriety. The direct offspring of 'trahere' may be left alone; they were tracks, tracts, and traces; they never become trucks, although trucks may become tracks. We must not truckle to Sussex, or any other county: if it cannot click the *t*, but must soften it to *g*, the School Board must be brought to bear upon it. If we are to say trug, then let us say Zomerzet, Yarkshur, and Brummagum. We, of London, are the salt of the earth, and salt enough to season everybody, and in London trug is a foreign word, and must be scouted. A truck basket and a truckle basket are things we can identify as connected with carriage. In the same way we know a truck or truckle bed and a truck system, where goods are carried in payment of wages instead of money. In *Hudibras* (i., 3) we have—

"He that is beaten may be said  
To lie in Honour's truckle-bed."

— **NEW AZALEAS.**—We have just seen some blooms of seedling Azaleas raised by Mr. WILLIAM CARMICHAEL. In the case of some of them the blood of his new hybrids from *A. amena* has been

used, and the result is enlarged double flowers, having that compactness of form peculiar to the species employed in the first instance. One of them, a purple-coloured variety, promises to be a great acquisition.

— **HARDINESS OF PRIMULA CORTUSOIDES AMENA.**—The Rev. C. WOLLEY DOD writes:—"I can confirm what Mr. HARRUP CREWE says about the hardiness of this Primrose, as I planted several plants of the white variety last spring on a rockery in a cold and damp part of Cheshire, and find them all coming up exceedingly strong. This agreeably surprised me, as I generally find white varieties of flowers are more tender than the species. For example, *Erica mediterranea alba*, and *Menziesia polifolia alba*, have both been killed in the last two winters, whilst the ordinary form has been quite unhurt. *Primula Munroi*, with white flowers, which survived the winter of 1878 on my rockery, has disappeared now."

— **CAMELLIAS OUT-OF-DOORS.**—In different parts of England, North as well as South and West, there are frequently to be met with a few examples of Camellias planted out-of-doors, and which have come out unscathed through the severest winters, so as to establish their claim to being hardy. Yet so few people see them thus fully exposed, that their power of resisting a low temperature is not thoroughly known. At Ashton Court, Bristol, there is a large vigorous bush, some 10 feet high, that has been long growing out in a bed amongst Rhododendrons and other shrubs in the grounds, where there is nothing to shelter it in any way. We recently saw the plant, and there is not a leaf or a flower-bud on it that shows the slightest effects of the winter, although there has been 24° of frost registered. Bays growing near it have been much cut, and we think the Camellia is now fully proved to be a hardy plant. The Ashton Court example is a red variety, the name not known. *Aralia Sieboldii* growing under the same conditions is not injured; *Phormium tenax*, somewhat seared, but not so as to do permanent injury.

— **NEW HYACINTHS.**—The exhibition of Hyacinths at South Kensington on Tuesday was as extensive a one as ever before seen in London, and though some good flowers were shown the general lack of massiveness and finish in the spikes justified the predictions of those who were of opinion it would prove an indifferent Hyacinth year. The wet spring and summer of 1879 appear to have exercised a baneful influence on the Hyacinth crop in Holland, as it did on garden crops in our own country. This lack of quality was perceptible especially in the case of the red Hyacinths, and more particularly the high-coloured varieties, which are no doubt among the most delicate of all. Of the new varieties Cavaignac is a good addition to the large-belled single blue class, the flowers are very large, solid, smooth, and stout, colour pale greyish-blue, with a distinct flame of blue down the centre of each segment, and the reverse of the bells azure-blue. It is worthy of remark that a new Hyacinth appearing at this distance of time should bear the name of the stout old Republican General of thirty years ago, but it cannot be a sport from the single red variety of that name, as some suppose, unless it has caused a striking change of character in the size and shape of the bells as well as the colour. Electra is a very delicate pale grey-blue single variety, really pale lilac instead of blue, with a slight blue reverse, spike large, full, and symmetrical, and having all the promise of a fine exhibition variety. Queen of Yellows surpasses its consort, King of Yellows, in that it has a deeper tone of colour, and the bells are clear and destitute of the green tips to the segments that, in its young state at least, disfigures the latter. Leopold II. is a single blue Hyacinth, well worthy of notice; one might term it a pale blue Argus, but with dashes of lilac on the surface of the segments: it forms a good and symmetrical spike. Charles Dickens, S.R., is a very novel and distinct variety: and while fleshy pink is the prevailing tint, there is a mixture of buff with it; the bells are large and finely formed, and there is the promise of a good spike. Grand Blue, single blue, has a deep and well defined stripe of deep blue on the pale grey-lilac segments; it also is a fine and distinct variety. Masterpiece, a rich shaded claret-coloured flower of the mauve class, as it is termed, has a fine and full spike of handsome segments,

— **THE ROYAL HORTICULTURAL SOCIETY'S JOURNAL.**—The library of the Royal Gardens, Kew (and we may add other libraries), is in want of the first number of the fifth volume of the present series of the *Journal of the Royal Horticultural Society*, to complete its set. As the number is out of print, it is hoped that some one who possesses the number may be disposed to send it to the Editors for presentation to Kew.

— **THORNTON HEATH HORTICULTURAL SOCIETY.**—The fourth annual exhibition of this Society will be held in the grounds of K. T. OELRICHS, Esq., Elm House, Thornton Heath, on Wednesday, August 18.

— **WEST OF ENGLAND ROSE SHOW.**—This exhibition is fixed to be held at Hereford on Wednesday, July 7.

— **EARLY TULIPS.**—We looked in vain for any appearance of novelty among these, except a pure white self-coloured form of Joost van Vondel, with flowers remarkable for their depth of petal and purity of colour. The original flower is a rosy-crimson self, with pencillings of white sometimes bordering to a flame. Mr. CUTBUSH states the sport is fixed, and this characteristic makes it a valuable addition to the white self Tulip. Chrysolora is still the best yellow, deep and clear, and a fine built flower: and Vernilion Brillant, a vivid crimson self. The Tulips were much below their usual fine proportions, as if they, in common with the Hyacinths, had suffered from the wet season.

— **SEEDLING AMARYLLIS.**—The splendid group of Amaryllis (*Hippeastrum*) staged by Messrs. VEITCH & SONS on Tuesday last were illustrative of what might be termed three different types of this rich and striking stove plant. In the tallest and palest coloured flowers were seen the influence of the blood of the old Dutch varieties, and one or two imported types were singularly fine and striking. In others, *Ackermannii pulcherrima* and *aulica* had apparently affected the pedigree, and their rich deep colour bore testimony to the presence of their blood. In a very few flowers—but they were singular because of their distinctness—the blood of *pardinum* was present; the chequered surface was in pleasing contrast with other forms. Undoubtedly the fine Peruvian Leopoldi had given much of its character to a large number of the seedlings; indeed, it has been used for two purposes—to give improved form to the flowers, and dwarfness to the character of the plant. That these characteristics had been secured to a large extent was plainly apparent, and Messrs. VEITCH & SONS are attempting something more—they are essaying to impart to these hybrids of Leopoldi greater depth of colour, that shall in great measure, if not wholly, cover the surface of the segments; and they are also endeavouring, not without evidence of accomplishment, to produce more than the usual twin flowers usual to the stout scape. It is also worthy of notice that some of these seedlings had flowered in the short space of nineteen months from the seed-pans, the average time required to produce flowering plants being from twenty-eight to thirty months.

— **DIRCA PALUSTRIS, THE LEATHER-WOOD OF VIRGINIA,** is by no means unattractive at the present time in the Cambridge Botanic Garden. It is somewhat a rare shrub—at least of the size here represented, and quite distinct in appearance. The outline formed by its branches is very nearly globular, and the twigs are so numerous as to make it very dense so far as it extends. On trying to pluck a branch the popular name by which it is known is found to be very appropriate, though strictly speaking the word bark should be used instead of wood, the property of toughness belonging really to the bark—a frequent circumstance in the *Thymeleae*. This shrub is now without a leaf, but being studded all over with drooping yellow flowers, becomes a subject for attention.

— **GARDENING APPOINTMENTS.**—We hear that Sir RICHARD WALLACE, Bart., has engaged Mr. BETHELL, formerly Gardener to W. H. WAKEFIELD, Esq., Sedgwick House, Kendal, to take charge of his fine gardens at Sudhourn Hall, Suffolk. Mr. BETHELL should here find full scope for the exercise of his well tried abilities.

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 371.)

**ODONTOGLOSSUM**—  
 ramosissimum, 396, i., '75  
 ramulosum, 579, '65  
 retusum var. *latro*, Rehb. f., 786, '68  
*ringens*, Rehb. f., 1035, '72  
*Rochii*, Rehb. f., 1302, '73 (fig.); 715, ii., '74  
 roseum, 404, '67; 715, ii., '74  
 Rossii majus, 715, ii., '74  
*Ruckertianum*, Rehb. f., 105, '73 (fig.); 715, ii., '74  
 Schlieperianum, 1082, '65 (fig.)  
 spectatissimum = *O. triumphans*  
*spilotanthum*, Lindl. et Rehb. f., 731, '72  
*stenochilum*, Lindl. et Rehb. f., 999, '72  
*tetraphyllum*, Rehb. f., 558, iii., '75  
 tripudians, 938, '71; 715, ii., '74  
 — var. *oculatum*, Rehb. f., 393, '72  
 triumphans, 516, '67 (fig.)  
 — var. *labello albo*, 503, viii., '77  
*ulopterum*, Lindl. et Rehb. f., 731, '72  
 Uro-Skinneri, 708, 724, '59  
*velutium*, Rehb. f., 406, i., '74  
*vevaticum*, Rehb. f., 809, vi., '76  
*zeaxillarum*, Rehb. f., 001, '67; 667, '72 (fig.); 644, '73 (figs.); 715, ii., '74; 748, iii., '75; 166, vii., '77; 173, viii., '77  
*Hutchinsii*, Lindl. et Rehb. f., 104, '70; 1498, '73  
 Wartnerianum, 579, '65 (fig.)  
*Warszewiczii*, Rehb. f., 270, iii., '75 (fig.)  
 Warszewiczii, Bridges (see *O. Schlieperianum*)  
*Weyeri*, Rehb. f., 461, iii., '75

**CEANTHUS**—  
 crocata, 140, '45 (fig.); 931, '72 (fig.)

**CENOTHERA**—  
 (see also *Godetia*)  
 bistorta, 844, '53  
 fruticosa var. *indica*, 118, '41  
 marginata, 734, '70  
 tetraaptera, 133, '45  
 Whitneyi, 1997, '70; 103, '71 (fig.)

**ODIUM**—  
 Tuckeri (Vine mildew), 779, '47 (fig.)

**OLDENLANDIA**—  
 Deppiana, 253, '54

**OLEA**—  
 ilicifolia = *Osmanthus Aquifolius*

**OLEARIA**—  
 dentata, 1498, '73  
 Haastii, 1194, '72 (fig.); 1498, '73; 778, viii., '77

**OMPHALODES**—  
 Lucillee, 715, ii., '74; 757, viii., '77 (fig.)

## Home Correspondence.

**The Influence of the Electric Light upon Vegetation.**—In the *Gardeners' Chronicle* of the 13th inst., in the article upon the electric light applied to horticulture, the remark is made that "It was unfortunate in this respect that a point was made of the unfolding of Tulip flowers when exposed to the lamp, the unfolding being due rather to the heat than the light." This variety positively refused to open in a temperature of 72°, but when brought under the influence of the lamp in a temperature of 70° it opened in less than an hour, and at the meeting of the Royal Society the pot containing the Tulips stood in a recess in the wall, and if I am not mistaken was directly over a heating apparatus, probably a coil of pipes. It was thickly covered with paper to exclude the light until it was wanted. When I undid the paper the flowers were closely shut up, and I am quite certain that the temperature was as high where it was placed as when placed upon the table under the lamp, where it opened in about forty minutes. At the lecture before the Royal Institution on the 12th, the pot of Tulips was placed at first upon the table again covered with paper, when uncovered it was in about the same condition as regards opening as at the Royal Society, and it was soon evident that it began to feel the influence of the light, but as the lamp was not so powerful and the time of exposure less, it did not open so much. Since then, I have repeated the experiment three times with the same result. Some varieties of Tulips, like all varieties of Crocus, may open in the dark when exposed to sufficient heat, but the variety in question would not do so. I am aware that vitality might upset these conclusions, but in the five above experiments such was not the case. If I may be allowed to offer an opinion on the application of electric light to horticultural operations, I would very decidedly say the advantages are very great. After seeing the light here in the conservatory in November, I became convinced that for forcing purposes here was a powerful agent ready to be turned to account. The vividness and correctness with which the various colours of flowers were brought out was a proof to me that the electric and solar rays were at least in some respects similar, and all I have seen in the various experiments carried out here goes to strengthen these convictions; and granting that electric and solar rays are alike, it will not require a very great stretch of the gardener's imagination to believe that a friend has made his appearance. In the month of December when a gardener looks at his languishing Cucumbers he knows he is perfectly helpless; he looks up to the impenetrable clouds, and his heart aches: but there are better times in store for him. Turn the engine on, and the new sun shines, and shmes just where it is required, and its power and intensity is in the operator's hands. I may be thought sanguine, and I know that when a man is mounted on a hobby-horse he does not exactly see how the animal lifts his hind legs, but still I am satisfied with his action, and feel sure that had we begun in time I should have been able to exhibit ripe Melons at the Horticultural Society on Tuesday last. The progress they have made during the short time the light has been applied is very remarkable, and its removal to a distance from the first planted ones is also evident. The leaves made since are wanting in that dark green colour which is so desirable, but of course every day now lessens the comparative results, and especially so in these unusually bright days. It is not many gardeners who are fortunate enough to have a scientific employer, but I believe there are many in the country who would gladly avail themselves of scientific agency to assist them in their various duties. Few have it in their power to obtain much scientific knowledge, and, generally speaking, would the word "scientific" enhance the gardener's written character? I doubt it, and have had reason to do so. I once went after a situation; while naming the places I had lived in as assistant gardener the gentleman gave me attention, but when I said I had lived two years (and was still there) in the Royal Botanic Gardens, Regent's Park, under Mr. Marnock, he threw up both hands, and exclaimed, "Oh, no, no! I want a man who can grow Grapes, Pines, Melons, Cucumbers, &c. Good morning." I turned away sadly, and began to ruminate on the possibility of my having made a mistake and was wasting time, but I got above the thought, and as long as I live shall I remember with thankfulness that I had the opportunity of living in the said gardens and under the said gentleman. Since writing the above the *Gardeners' Chronicle* of the 20th has come to hand, and I note, as arranged, that two pots of Strawberries were to be exhibited before the Royal Society by Mr. Siemens on the 18th; but if they have either sweetness or flavour it will be a decided proof of not only what electric light can do, but also of the short space of time it can do it in.

These Strawberries were not under the light more than 137 hours, and although coloured they could not possibly be ripe. I hope I shall be found wrong, but I shall venture the opinion that they have been found wanting in flavour simply because they have not had sufficient time. *D. Buchanan, Sherwood Park.*

**Vale Royal.**—This is the name of the estate upon which Lord Delamere resides when in Cheshire, and is about 3 miles from Northwich and 12 miles from Manchester. I recently paid a visit to the gardens, and was kindly conducted over the grounds and through the range of glasshouses by Mr. Milne, the head gardener. In the course of my visit I observed a few things which I think deserve special mention; and in the first place I would remark that it is often possible to produce the most charming and effective results from inexpensive plants. This was illustrated in a very marked manner on the occasion of my visit to the above place, where I saw, in a span-roofed house about 25 yards long by 8 yards wide, a picture I shall never forget. The elements which made this picture were as follows:—*Begonia manicata*, *B. nitida*, *B. Ingrami*, and *Adiantum cuneatum*. This house was filled with these four kinds of plants, artistically arranged—the *Begonias* in excellent bloom, and the *Adiantums* judiciously intermixed with the flowers. Anything more beautiful it has never been my lot to see. *Pimulas*, *Cinerarias*, and *Mignonne* are grown here in large quantities, and are marvels of culture. Peaches, Nectarines, and other fruits under glass, gave promise of an abundant crop, and as an example of good "all round gardening," Vale Royal will bear favourable comparison with any establishment it has ever been my privilege to see. *B. E.*

**Pulmonarias.**—Few hardy plants are more effective in early spring, especially on strong cold soils like mine, than *Pulmonarias*. I have tried for two or three years by begging and buying to obtain all the sorts in cultivation. Besides those which belong to the genus *Mertensia*, I find the following eleven names in catalogues:—*P. angustifolia*, *azurea*, *caucasica*, *grandiflora*, *mollis*, *mollis alba*, *officinalis*, *rubra*, *saccharata*, *sibirica*, *tuberosa*. Excluding the white variety, which seems to belong to *officinalis*, I had reduced the other ten to four, namely—1, the common old Jerusalem Cowslip, usually known as *officinalis*; 2, a more compact growing species with smaller spotted leaves, and bright azure-blue (never red) flowers. No. 1 spreads its root-stock underground, and the shoots all grow upright. No. 2 keeps a single root-stock, and the shoots slope away from it. Three or four plants of this were sent to me in a letter from the neighbourhood of Poole, in Dorsetshire, where it is common, growing wild. They all agree in their characteristics, and I have always called them *angustifolia*. No. 3 has larger leaves, with more patchy and conspicuous spots than *officinalis*; flowers larger, generally red, occasionally blue; bought as *sibirica*, but it is sold also as *caucasica* and *rubra*. No. 4 resembles No. 2 in habit of growth, but has much narrower leaves, and entirely without spots; the flowers are dark purple and dark red. I sent flowers of Nos. 3 and 4 to an eminent authority to be named, and they were named *officinalis* and *angustifolia* respectively. I do not question the correctness of this, but it in fact reduces all my *Pulmonarias* to one, for in *Bentham's British Flora* (p. 577) we are told that "in many parts of the Continent the two forms (*officinalis* and *angustifolia*) pass very gradually one into the other," and are, therefore, one species. If I knew where to obtain any distinct varieties or species I would gladly either buy or give plants in exchange for them, but I have worked up all the herbaceous catalogues I can get. *C. Wolley Dod, Grange-over-Sands, Lancashire.*

**The Effect of the Past Winter on Hardy Plants.**—In compliance with your invitation to your readers in a "leader" in last week's *Gardeners' Chronicle* to place on record the effects of the past winter on hardy plants and vegetables, I have carefully taken note of those plants and shrubs that have suffered most here. I do not propose to say anything about vegetables for the present. Before I proceed to offer a few brief remarks upon the plants that seem to have suffered most it will perhaps be as well to state that all kinds of hardy plants and Conifers grow luxuriantly in this climate. The soil varies very much, from a rich alluvial loam to a poorer soil, resting on a bed of gravel. The climate in ordinary seasons is so favourable to plant-growth that the choicest and most tender Conifers grow to an amazing size in a few years, the only drawback being that of excessive humidity in wet seasons, which renders all kinds of hardy plants, Roses, and fruit trees more susceptible to injury from frost. The extraordinary vigour, however, of Conifers and other ornamental trees and shrubs enables them to weather an occasional storm when plants of less robust health would succumb to its influence. It is surprising how little trees and shrubs have suf-

fered here compared with the duration and severity of the past winter. There is just one point that should be made clear to a certain class of your readers, and that is, that plants that are either killed outright or are so severely injured as to render their recovery hopeless should not be discarded altogether unless the circumstances connected with their demise are so clear that there would be little prospect of their ever succeeding if planted again. Two consecutive winters such as 1878 and 1879 are, so far as I have been able to gather, of very rare occurrence, and therefore many plants that would have outlived our severe winter are killed altogether by the second chiefly in consequence of want of light and sunshine to ripen the wood to a degree that would render it weather-proof. *Camellias* planted out-of-doors had not a brown leaf this time last year, but they have suffered a little last winter, doubtless because of the immaturity of the wood. *Hydrangeas* are killed back a little; *Magnolia grandiflora* has suffered slightly, *Berberis Darwinii* severely. Tender kinds of *Rhododendrons* have gone "soft in the bud," and Sweet Lays have been scorched as if they had been set fire to: perhaps these are worse than anything else of the hardier class. *Kalmias* that made second growth in the autumn are, of course, killed back, but not permanently injured, and shrubby *Veronicas* are killed to the ground; *Euonymus* have also suffered in almost all situations. Amongst a large collection of Conifers *Picea lasiocarpa* and *Pinus* are the only kinds that have suffered, the latter but slightly. *Roses* have suffered seriously in this neighbourhood generally. When the frost set in last November the earth was in excellent condition, and to this fact we attribute our good fortune in losing so little. I shall have a different tale to tell of vegetables. In all reports of this kind there should be great scope allowed for the different conditions under which all kinds of plants are grown; soil, situation, rainfall, altitude of locality, and thick or thin planting are substantially amongst the foremost grounds upon which information should be furnished on this important subject. *Dorset.*

**Pentstemons.**—Among the many beautiful hardy perennials there are few, if any, to rival these in the showiness of their flowers, or to compare with them in general usefulness for decorative purposes in the herbaceous border, where if they do not come into bloom quite so early as many other things, they continue long after, and only give in when frost holds them fast in its grip. In mild winters I have cut from them till after the turn of the year, and as they are so persistent and free in their habit of blossoming, I mean to try some in pots, as under the protection of glass in a cold frame or a greenhouse they would be quite safe and come in most valuably at a time when flowers are scarce. I find that the best for autumn blooming are those raised annually from seed, from which, now there has been such a vast improvement effected in them, splendid varieties may be obtained, differing materially in shade of colour and markings, as well as in the size of the flowers. If the finest strains are obtained, these may be had almost as large and fine as those of *Gloxinias*, and any that show extra merit in this way can always be propagated and perpetuated by cuttings. To have the plants strong and such as will afford fine spikes, the seed cannot well be sown too early, and if this be done at once, and the pans or pots containing them placed where they can get a little warmth, they will soon germinate and be fit for pricking off in boxes, or under the shelter of handlights, where they can be protected and nursed on till large enough for finally planting out in the open. To give them a fair chance, the situations intended for them should be well broken up and have a little rotten manure well worked in, which will induce vigorous shoots, and enable the plants to become established before the advent of dry weather, so trying to fleet-rooted subjects like *Pentstemons*. Besides being so serviceable in borders *Pentstemons* make magnificent beds, the best form of which are circles, and these of moderate size, as then the whole of the flowers can be seen to advantage. *J. S.*

**A New Metal.**—A new compound metallic substance has been discovered by Mr. J. Berger Spence, which promises to be of great utility to the fine and industrial arts. As it will probably be of service for many horticultural purposes, it may be interesting to some of your readers to have the subject mentioned in your columns. The compound has been named Spence's Metal, and is formed of a compound of molten sulphur and metal, which hardens on cooling into a solid tenacious metal of a dark grey colour. It has the valuable property of expanding on cooling, instead of contracting as most other metals do. Favourable reports of it are given by some of the London and Edinburgh gas and water companies who have used it for the purpose of making joints in water and gas piping. The advantages claimed for it as a jointing material are:—1st. Its expansive property on cooling. 2d. Its cheapness, being only

about one-fourth the price of lead. Lead costs about £18 per ton, Spence's metal costs £15 per ton. A ton of the latter is fully three times the bulk of the former, and would therefore go full three times as far as lead in working. It is easily melted, lead requiring a temperature of 620°, while Spence's metal melts at 320°. At a lower heat it is said to become pasty, it also gets into the same condition when the temperature rises about 350°. Its suitability for hot-water joints would of course depend upon whether or not it would be affected by the heat of water at or near boiling point. In all probability Spence's metal will be extensively used for medallions and busts, vases, ornamental castings and such-like, as it is said to take and to retain a perfect impression, and a high polish; while so far as present experiments have gone, it appears to be entirely free from atmospheric influences. These properties would be valuable in the event of the material being made into labels, all the more as it can be produced in various colours from the colour of bronze to the deep blue of steel. A compound of molten sulphur and sand has long been in use as a substitute for lead in running in iron standards into stone for fencing purposes. I know of a fence, about a mile in length, by the side of a public road, which was put up some twenty years ago. The standards were run into the stone with a mixture of sulphur and sand. The fence is as firm and straight now as when it was first put up, and the teeth of time seem to have made less impression on the sulphur composition than on the stone in which it is imbedded. *D. M.*

**Asparagus Kale.**—That this vegetable when grown in soils of a cold and retentive nature is liable to rot off (p. 370) in the autumn cannot be gainsaid; but in soils of an opposite character losses from this cause are few and far between. As a proof of this, I may state that out of 400 plants we have lost less than forty. It ought not to be planted in ground which has been heavily manured. On the contrary, it is much better to plant it on ground which has been previously occupied by some crop of an exhausting nature, as then its susceptibility to rot is reduced to a minimum. I am unable to state what amount of frost it will endure, suffice it to say that 8° was the lowest reading of the thermometer in the gardens here. *J. Horsfield, Hextesbury.*

**Wood-ashes and Soot.**—We have now arrived at that part of the season when gardens become infested with different kinds of insects injurious to vegetation, one of the most troublesome of which is the Turnip-fly or Black Jack, so fatal to seed-beds of Broccoli, Cauliflowers, and all other varieties of the Brassica tribe, which the flies assail almost immediately they are out of the ground, to the utter destruction of the hearts of the plants, thus causing the whole of those they feast on to become blind and useless for pricking out. To ward off their attacks there is nothing better than a frequent dressing of wood-ashes and soot in about equal proportions, put on early in the morning while the leaves are moist with dew, when the finer particles stick and render them unpalatable to the Jacks, which take themselves off to fresh fields and pastures new. Besides being so inimical to these pests, the soot and ashes are excellent fertilisers, and just of the kind suitable for stimulating the growth of young seedlings of any of the vegetables above-named. Slugs, too, have a great dislike to them, especially if a little fresh-slaked lime be added, which mixture is most valuable in any garden to keep a store of, that it may be always ready to hand when wanted. It is not the heavy application of it which is needed, as that is liable to do harm, but it is the dusting over at intervals of a few days that bothers the insects, and brings about their discomfiture. Unfortunately, wood-ashes are difficult to get in most places, and the way we meet this is to make our own, by saving all the prunings of Gooseberries, the clippings of hedges, rakings of leaves, and any rubbish of that kind which will burn. To get to do this freely, and consume any weeds or other gatherings, we take advantage of a dry time to start the fire, which is kept going till the whole is passed through. Any that is not required for seed beds comes in admirably for sowing amongst growing crops, all kinds of which are benefited by its use. Where the supply of manure is deficient for these it may be eked out by adding to the soot and ashes some guano, which, if incorporated and scattered thinly over the ground just before the advent of rain, effects wonders even on the poorest of land. Vines, too, are especially benefited by a spring dressing of the border with these last-named ingredients, which soon show how agreeable they are in the improvement they work on the foliage. *J. S.*

**Spent Hops.**—It may not be generally known that spent Hops are rich in fertilising qualities and most valuable for applying on light lands, where, stirred in beneath the surface, they assist greatly in keeping it moist and bringing about a healthy root-action. Soaked with liquid-manure, or mixed with

soot by turning them over, no better dressing need be desired; and any one therefore living near breweries, where they can be obtained for the carting away, should not lose an opportunity of securing as many as they want or have use for. The thing is to let them rot by undergoing very gentle fermentation, during which their decomposition may be much hastened by frequent stirring over, and bringing the outside each time the process is carried on into the middle, where the chemical action soon breaks up the fibre by causing decay of the parts. *J. S.*

**Proliferous Plantains.**—Some years ago I found a monstrous variety of the *Plantago* major growing in a piece of rough ground far from cultivation almost exactly like the variety you figure at p. 364. I made a drawing of it at the time, but have never seen another specimen like it. *William Wickham, Binstead-Wyck, Alton.*

—The following lines, which I quote from *The Loves of the Plants*, Canto I., may interest some of your readers, as showing that proliferous Plantains were not unknown to the distinguished author of the *Botanic Garden*, Dr. Erasmus Darwin:—

"With strange deformity *Plantago* treads,  
A monster-birth! and lifts his hundred heads.  
Yet with soft love a gentle belle he charms,  
And clasps the beauty in his hundred arms." *W.*

**Trug Baskets.**—Baskets exactly similar in appearance and description to the one mentioned in the *Gardeners' Chronicle* are used in North Wales. I had one to take out Fern hunting, and the woman who weeded my flower garden always used one of them. *Helen Watney.*

**Fruit Trees in Pleasure Grounds and by the Roadside.**—The general cry out in England is at the great scarcity of fruit, and no wonder, considering the many waste places there are where trees might be planted, but somehow or other an idea appears to have taken possession of people's minds that they are only suitable for gardens or orchards, which is the most mistaken notion possible, for what can possibly be more ornamental on a lawn or grass-plot than an Apple, Pear, Plum, or Cherry? either of which are alike beautiful when in flower or fruit, the former especially with their rosy cheeks; and I think we have it somewhere on record that Newton was instructed in the law of gravitation by having one fall on his head. Although a tap in the same way on the pate of a schoolboy might not set him pondering in a similar manner, he would take it as a good joke, and look on the cause of it as lawful prize; and if Apples and other fruit were to be found tumbling about by the sides of lanes and hedgerows, or were more common than they are, there would not be the incentive there is for urchins to steal. I have never had the pleasure of travelling on the Continent, but I am told that trees are so planted and are abundant enough for the inhabitants of those favoured parts to look on the fallen produce as common property, provided they do not trespass for it; and if such a system of growing fruit answers there, why not here, where we stand so much in need of it? We have plenty of old pollards of various kinds that are no great ornament to the landscape, whereas trees in bloom in spring are a sight that gladdens every one, and are most beautiful objects to behold. Apple blossoms, with their lovely pink petals, never fail to command admiration, and the snowy-white of the Cherry and Plum is a vernal garb that looks like purity itself and is fit to be seen anywhere. Why then are they not planted near dwellings in shrubberies on lawns and in pleasure grounds where they would be attractive objects for at least six months in the year? True, the birds might visit the Cherries, but what of that? They deserve their share, as they cheer us with their song and thus add to our pleasures in life, one of the greatest of which is to have our feathered friends around us to hear their melody and see them hopping about. Fruit trees now are not expensive, and landed proprietors might therefore at small cost confer a great national benefit by planting largely on their estates; and if they would only enlarge cottage gardens and put some there it would be a step in the right direction. Owners of villa residences have the matter in their own hands, and may adorn their grounds with that which is useful as well as ornamental instead of having the unsuitable things often seen in such places. One has only to walk in the suburbs of our large cities and towns to witness the most absurd filling up of the forecourts of these dwellings, where in a few rods of ground are to be found fast growing Firs and other trees in sufficient number to plant a small wood, when at the same time perhaps they have scarcely an Apple, Pear, or Plum belonging to them; and yet either of these latter would be far preferable in every respect. *J. S.*

**Chimonanthus fragrans.**—There is a very fine tree here, over 10 feet high, trained against the side

of the house, and it has for the last six years been covered with blossoms, but this winter the bloom has failed. *Helen Watney, Liss, Hants.*

## Reports of Societies.

**Royal Horticultural:** *March 23.*—H. J. Elwes, Esq., in the chair. At the termination of the usual business proceedings, which on this occasion were conducted in the large conservatory, Dr. Masters explained the nature and results of the important experiments in forcing which have been made by Dr. Siemens with the electric light, and which are fully alluded to in another column. At the invitation of the Council, Mr. Shirley Hibberd then gave a brief lecture on the history and characteristics of the Hyacinth and the Amaryllis. The former, said Mr. Hibberd, was a comparatively modern flower, and certainly less ancient as a florists' flower than the Tulip, Narcissus, and Lily. It was reported in the books that John Parkinson had above fifty varieties of Hyacinths, but when he turned to the *Paradise* he found that of the true oriental Hyacinth, which alone of this class is the flower of the florist, Parkinson had but eight varieties, some of which in respect of their relationship to the Hyacinth proper were certainly in a doubtful position. John Gerard had about half-a-dozen, and amongst them a good double blue, which in Johnson's edition is admirably figured at p. 114. Going back to Dodoens, he found that in 1550 this botanist of the Low Countries was acquainted with the oriental Hyacinth, the flowers of which were of an excellent blue colour, and at p. 206 of Lyte's translation of his *History of Plants* will be found a figure showing that the Hyacinth of that day was a poor thing, producing a few single flowers such as those we are accustomed to see on offsets of a year old. It is remarkable, however, that the Hyacinths of the older writers, however genuine as representing the oriental species, comprised only blue and purple and white varieties. The old masters were apparently ignorant of the glorious crimson and carmine and the delicate yellow coloured Hyacinths that are now so much prized in displays of spring flowers. When these originated may be guessed at, but we should probably never know to a year, or even to fifty years, when they first appeared, and those who discovered or raised them appear not to have bequeathed to us any records of their benevolent deeds. It is certain, however, that Holland was the first home in Europe of the oriental Hyacinth, and to the plodding race of commercial florists who now supply us with bulbs the world is indebted for the creation of the Hyacinth as a florists' flower. And it was pretty certain that they had it well in hand at the very time our fathers of horticultural literature were in the thick of their work, for Swertius, in his *Florilegium*, as cited in Martin's edition of Miller, in the year 1620, figured forty varieties, and very scrupulously avoided representing anything so heterodox as a double flower. In Martin's edition of Miller reference is made to Peter Voorhelm, who must have been in the flesh about the year 1680, as a great cultivator and raiser of new varieties, and the first to recognise, with a true florist's perception, the merits of the double flowers. It had been his rule to throw them out of his collection, but he was himself thrown out at last, and while on a sick bed a number of double seedlings took advantage of his absence to enjoy life in their own way, and thus they, for a time at least, escaped destruction. Voorhelm had the good fortune to see one of these, and having kept it and increased it, obtained good prices for the offsets, and that fine old stimulant, money, made him thenceforth a raiser of double Hyacinths. The first-named variety of this class was called Mary. This appears to have been soon lost. It was followed by one called the King of Great Britain, which was so much in favour that the price of a bulb was 1000 florins. This price was soon doubled by the demand that arose, and thus at the end of the seventeenth century we have an instance of a Hyacinth valued at about £200. The Tulip mania was at its height in 1634 and two years subsequently. It may be said to have come to an end with the celebrated declaration made at Amsterdam on February 24, 1637, rendering speculative purchases null and void. At all events, the Tulip had ceased to inspire the rapacity of gamblers and the eccentricities of madmen, and had left a lesson such as not even the recent run upon imaginary water stock is likely to confer upon the present generation. The Hyacinth, therefore, which was then as it were forming itself for fame, was happily preserved from all taint of speculative trading, and the prices paid for scarce and beautiful varieties were simply testimonies of the esteem of amateurs for these new and attractive flowers. It is well for floriculture when prices rise to a point encouraging to systematic endeavour. To raise new flowers is a tedious and costly proceeding, however delightful it may be, and if the business is not seasoned with a moderate spice of the commercial element it is not likely to acquire

the full proportions of usefulness. In the case of the Hyacinth we saw clearly what happened as a consequence of the profit attending the production of new varieties. In 1768 was published at Amsterdam the Marquis de St. Simon's treatise, *Des Jacinthies*, in which it is declared that the town of Haarlem was then environed with Hyacinth farms, and the Dutch florists had named and described about 2000 varieties of the fragrant flower. Mr. Hibberd next remarked that he was not prepared to say how many acres of Hyacinths might be found at Haarlem at the present time, but he would advise any lover of flowers who had not yet seen those flower farms to pay them a visit at the time when they are in their full glory, for they then constitute a spectacle not less unique than wonderful—so vast, so various, and so rich are the displays of colour, and so delicious the perfume diffused far beyond the range of the flowery fields. From the middle of April to the middle of May Haarlem was steeped in splendours that no dying dolphins could imitate, and the rich setting of the green meadows all around enhances the brightness, while adding to the completeness of the picture. To state the exact number of varieties now in cultivation is perhaps impossible. It probably does not exceed 1000, and of these we might perhaps spare 700 or so without any serious loss. In the spring of 1873 he flowered at Stoke Newington a collection of 500 varieties, and found fully one-third of the whole number wanting the qualities that constitute average merit. A report of the trial would be found in the *Gardeners' Magazine* for 1873, and it would be out of place there to bring forward any of the minute details. But he might mention that the mid-season flowers proved to be the best, and the blue and white varieties were in most cases superior in quality to the red. Thus it appeared that in raising flowers by cross-breeding we must expect to lose quality with every gain in departure from the normal type. As regards the distribution of merit, however, in connection with the season of flowering two very important facts were noted. The earliest flowers that appeared were of good quality, but those of the mid-season were better. But as the later kinds came into bloom we obtained an exhibition of the merest rubbish, and the later the sort the worse was its quality. Thus, as the case stands at present, late-flowering Hyacinths appear to be altogether undesirable. With reference to the cultivation of these charming flowers in Holland, Mr. Hibberd stated that the soil in which they are grown for market is sheer sand or blackish sandy peat, often of such a loose nature that the workmen attach flat boards to their boots to prevent their feet sinking into it. And so liable is the sand to be blown away that it is a common practice to scatter Hyacinth flowers over vacant plots, for no man liked to see his estate fly through the air and settle within another man's boundaries. The land is usually prepared by dressing it heavily with manure from the cowsheds, and for this an almost fabulous price is paid. The land being ready, and loaded with manure, is planted with Potatoes, and this crop being removed it is ready for planting with Hyacinths. When a crop of Hyacinths has been taken the land is planted with Tulips, and the next crop may be Tulips again or Crocuses. Then the land is once more refreshed with a heavy dressing of cow manure, and the rotation is repeated, beginning with Potatoes. The Hyacinth takes us to the east, its home being the mysterious country known as the Levant. The Amaryllis takes us to the west, the species that are most prized in our gardens being natives of the New World. But the examples of so-called Amaryllis that had delighted them were not Amaryllis, but members of a genus called *Hippeastrum*, or equestrian star, one of the species being striped in a way to suggest the name. But the florists had never called them by Dean Herbert's name, and in this matter he (the lecturer) would stand by the florists, for the people who have to use a language should have some part in making and keeping it. It was only a case of conservative reaction, and indicated the unchangeable inborn gallantry of the florists in preferring a heroine of Theocritus and Virgil to a fancy of a serious Churchman. But the classification of Dean Herbert had a sound scientific basis, and the *Hippeastrums* stand apart as a section of Amaryllis marked by unmistakable characters. In respect of cultivation there were two matters of considerable importance to be mentioned. One was, that the species of *Hippeastrum*, all of them derived from the tropical zone of the Western Hemisphere, interbreed most freely, and hence the florist may find endless delight in raising new varieties, and the student of the origin of species may turn to them for the solution of problems, or to encounter fresh ones that he will never be able to answer. And another matter of importance was that these noble flowers were really difficult to manage, and consequently many fail before they learn the way to complete success. They rarely thrive in a peat soil, and they never thrive unless they are perfectly drained and watered judiciously. In common with many tropical plants, they can be brought into flower at almost any time; nevertheless, the spring was the

best time to flower them, because they need a clear solar light to develop their splendid colours, and the subsequent summer heat favoured the ripening of the bulbs.—On the proposition of Sir Charles Strickland, a hearty vote of thanks was accorded to Mr. Hibberd for his most interesting lecture, delivered in about the worst place for speaking in public that ingenuity could devise.

**SPRING SHOW IN THE CONSERVATORY.**—It has seldom been the good fortune of the Society, even when it could afford to offer prizes for competition, to be favoured with such a display as was made on Tuesday last, and, it must be observed in their honour, by a very few exhibitors. The exhibition of Amaryllis made by Messrs. Veitch alone was worthy of all praise; but when we add that Mr. R. S. Williams also exhibited a choice group of these showy flowers—that Hyacinths were shown in great force, if not in such fine condition as heretofore—and that the new General Horticultural Company (John Wills), Limited, contributed an extensive and most effectively arranged group, we shall have given some idea of the pleasing character of the exhibition. The collection of Amaryllis shown by the Messrs. Veitch, and which gained for that firm a large Gold Banksian Medal was, we should say, undoubtedly the most remarkable one that has been seen in this or any other country, consisting, as it did, of some 350 plants, all in flower to the day, nearly all, or by far the larger proportion being unnamed seedlings flowering for the first time, and representing as a whole a triumph of art in hybridising and of skillful cultivation. Of the parentage of these seedlings we know nothing, but it is evident that they are the result of only one or two crosses, two well-marked types of flowers being most numerously represented by varieties but slightly varying from each other, and consequently an impression of sameness was created, which a careful examination of the flowers did not shake off. One of the seedlings was labelled as blooming nineteen months from the date of the seed being sown. The Messrs. Veitch also exhibited a collection of Hyacinths and Cyclamens, the former being the best plants exhibited, but not so fine as usual. The splendid group of plants previously alluded to as being exhibited by the General Horticultural Company (John Wills), Limited, was also deemed worthy of a large Gold Banksian Medal. Fine-foliaged plants were represented by handsome young specimens of various Palms and Dracaenas, Crotons and Ferns, Nephentes and Sarracenias, relieved with a grand mass of forced Lilac, small clusters of Spireas, Cyclamens, and lovely Orchids, such as *Phalaenopsis Schilleriana*, various *Odontoglossums*, *Dendrobiums*, and *Cypripediums*, &c., the whole being set in a carpet of Maidenhair Fern, and arranged in Mr. Wills' usual effective style. Next to these two collections, by far the most striking was an extensive display of Hyacinths, Tulips, and Lily of the Valley, backed up by a grand row of plants of *Spirea japonica* and *Dicentra spectabilis* alternately arranged. The Spireas were especially fine examples of high cultivation, and while we cannot say as much in praise of the Hyacinths, we are bound to say that a better lot as a whole, or a more extensive group, could scarcely have been expected from a private grower; and the Gold Medal awarded was well deserved. The exhibitor was Captain Patton, 1, Langford Place, Abbey Road, St. John's Wood, whose gardener is Mr. Boulwood. Mr. William Bull also received a Gold Medal for a select group of plants, consisting of Palms, Cycads, and Ferns, and a number of Orchids in flower, together with striking specimens in flower of *Sarracenia Drummondii*, and *S. flava* major. Silver Banksian Medals were also awarded to Mr. B. S. Williams for the choice and select group of Amaryllis above alluded to, and which was shown in conjunction with an admirable little group of Orchids, which included a handsomely flowered specimen of *Celogyne ocellata maxima*. To Mr. H. B. Smith, of Ealing Dean, for a remarkably fine group of Cyclamens of various colours. To Messrs. W. Cutbush & Son, of Highgate, for a group of Hyacinths and Tulips, and several pans of admirably flowered Lily of the Valley; and to Mr. J. Aldous, Gloucester Road, for a group of decorative plants. To Messrs. Osborn & Sons, Fulham, a Silver Flora Medal was awarded for a group of stove and greenhouse flowering and fine-foliaged plants and an extensive collection of Hyacinths and Tulips.

**SCIENTIFIC COMMITTEE.**—Sir J. D. Hooker, K.C.S.I., in the chair.

**Report on Injurious Insects.**—A copy of Miss Ormerod's report for 1879 was presented by the reporter, and in reference to it mention was incidentally made of the circumstance that the author was collecting materials for a complete history of the remedies available for dealing with various insect pests, and would feel indebted to any observers who would furnish her with accurate information on the subject.

**Plants Shown.**—Mr. Elwes showed a spray of a *Vaccinium* known as *V. Morteni*, a very pretty green-

house shrub, with small ovate leaves and racemes of clear white bell-shaped flowers. As there was some doubt as to the name a further report will be made. *A. Fritillaria* from Japan was shown by Messrs. Veitch, and is supposed to be *F. verticillata* var. *Thunbergii*. It has long linear leaves terminating in a tendril and small greenish-yellow, bell-shaped flowers, faintly mottled with purple. Colonel Clarke showed a yellow *Chrysanthemum* in full flower, and explained the method by means of which he succeeded in getting the plant to flower at so unseasonable a time. The plant, when the flowering period is over, and after a short rest, is put into a steaming hot temperature for a time, with the result of causing the development of heretofore latent buds on the young stem. Colonel Clarke also showed a spray of the Lace Bark, *Lagetta linearis*, in bloom. The broadly ovate leaves are of a rich green colour, while the cylindrical flowers are of an opaque white. The name lace-bark was given on account of the netted character of the inner bark, which is used as a substitute for lace in Jamaica. A curious *Begonia* from Cochin China, with prostrate stem and obliquely ovate leaves of a purplish colour with a central blotch, was shown by Messrs. Veitch, and excited much curiosity. It was not in a condition for determination, but had the provisional name of *B. Davidiana*.

**Wood from Gravel Deposit.**—Mr. W. G. Smith exhibited a piece of a tree-branch recently thrown out from the base of a 25 feet excavation of sand and gravel at Shackelwell. The wood dated back from the deposition of the gravel and sand by the Thames at this place. The drift deposit here belongs to one of the higher and older terraces of the river.

**Japan Birch.**—Dr. Masters showed, for Messrs. Maule, of Bristol, a portion of the trunk of this tree, perhaps a variety of *B. utilis* (see *Gardeners' Chronicle*, 1876, vol. v., p. 630). The bark was of peculiarly silvery-white papy nature and very beautiful. Messrs. Maule write:—

"The specimen of Japan Birch is cut from a tree in our nurseries. We got it from seed at the same time we raised *Pyrus Maulei*. We do not consider that there are two species. The specimens sent you we considered were all the same, as even the common Birch differs a little from seed; but all of these Japan Birches are paper-barked and silver without exception. You know that our common Birch is sometimes silver-barked and papy, but not always, and they do not assume this until old trees. This Japan Birch is a very robust grower, does not run up like the common Birch, and will make a useful tree. We have about ten large trees, 15 to 20 feet high, and several hundreds 2 to 3 feet. We intend increasing it, as it seeds freely."

**Forcing by Electric Light.**—Dr. Masters brought forward some specimens exhibited by Mr. Buchanan, gardener to Dr. Siemens, and commented on the new power placed in the hands of the gardener by the agency of the electric light. The specimens from Dr. Siemens' garden consisted of—

1. Three pots of seedling Mustard, one of which had been exposed to the electric light, one to the daylight, and one to both—other conditions being equal. In this case there was not much difference in point of vigour, but the plant which had been exposed to solar and electric light was darker in colour.

2. Two buds of Countess of Oxford Rose, one exposed to the electric light for forty-eight hours, one grown as usual. The bud under the electric light was considerably more advanced.

3. Two spathes of *Calla aethiopica*, one grown in the ordinary manner, the other subjected for forty-eight hours to the electric light. In this case the difference was exceedingly striking, the plant which had been grown under the electric light being greatly in advance of the other. Cut specimens similarly treated manifested an equally striking difference.

4. Three pots of Carrots, three in each pot: one had been exposed to continuous light, first solar, and then electric; one had been exposed to the electric light only, and one had been exposed to daylight only—all other conditions being uniform. In these latter specimens there was very little difference between the plants grown under solar and those under the electric light, but the plants subjected to both were greatly superior in vigour and colour.

**Insects Injurious to Cypress.**—Further specimens were sent by the Hon. and Rev. J. T. Boscawen, which were referred to Mr. MacLachlan. The injuries inflicted were very serious, the whole of the branches on the lower two-thirds of the tree being killed.

**Retirement of Mr. Jennings.**—Dr. Masters moved, and Colonel Clarke seconded, a resolution expressing the regret of the committee that they were about to lose the services of Mr. Jennings, and conveying the thanks of the committee to Mr. Jennings for the ability and courtesy he had displayed as secretary to the committee. The resolution was carried unanimously. An expression of regret was also made that the Council had not notified to the committee the fact that the services of Mr. Jennings were to be discontinued.

**FLORAL COMMITTEE.**—Dr. Denny in the chair. New Hyacinths were shown to-day by Messrs. James Veitch & Sons, Messrs. W. Cutbush & Son, and Captain Patton, but only two were certificated, and those are named below. From Messrs. James Veitch & Sons also came a batch of seedling *Amaryllis*, three of which were certificated; also flowering plants of the ordinary form of *Spirea japonica*, and its variety *foliis aureis*, which has a denser spike of flowers than the former; a species of *Futilaria* from Japan with small pale green flowers; the banded *Juncus zebra*, and the white-flowered *Epidendrum bicoloratum*, which is so striking by reason of its prettily pencilled labellum. Mr. B. S. Williams showed *Imantophyllum miniatum* var. *Martha Reimers*, with a splendid truss of orange-scarlet blossoms; also the semi-double-spaced form of *Anthurium Scherzerianum*. Messrs. T. Jackson & Son, Kingston, sent specimens of light and dark coloured forms of *Primula denticulata*; and the major form of *P. rosea*, shown under the name of *P. Stewartiana*, by which its seeds were first offered to the trade. A sporting *Cyclamen persicum*, with white and rosy-purple flowers on the same plant, was shown by Mr. W. Kimpson, of South Paddock, Ashford, and dignified with the name of *Miss Catherine Hugessen*. The General Horticultural Company showed well grown examples of a new *Dracena* named *Thomsoni*, with large broad green leaves, margined with crimson. Mr. G. Goldsmith, Hollenden, Tonbridge, exhibited a well flowered specimen of *Trichopilia suavis*, and received a Cultural Commendation.

#### NEW PLANTS CERTIFICATED.

First-class Certificates were awarded at this meeting to Messrs. James Veitch & Sons for *Amaryllis* King Arthur, a remarkably fine-shaped flower, of good size and great substance, very smooth, in colour creamy white, shaded with crimson; for *Amaryllis* Empress of India, a very large flower, a rich shade of scarlet in colour, with a white centre; for *Amaryllis* Storr's Beauty, a crimson-scarlet flower, with a white bar at the base of the segment, and smaller in size than the last-named; for *Hyacinth* Cavaignac, a single blue sport, we presume, from the red variety of the same name—it is a large porcelain blue flower of the Czar Peter type, and of excellent quality; and for *Hyacinth* Queen of the Yellows, the best yet shown in its class, its merits consisting of a larger and closer spike, and larger bells than are found in such sorts as *Ida*, &c. Mr. B. S. Williams also received a First-class Certificate for a charming *Amaryllis* named *Exquisite*, a medium-sized flower, bright scarlet in colour, with a white bar down the centre of the segments; and a similar award was made to Mr. Greenfield, gr., The Priory, Warwick, for *Cineraria* Mr. Thomas Lloyd, an exact counterpart of the double one shown at the last meeting, except in colour, this being a rich deep blue.

**FRUIT COMMITTEE.**—H. Webb, Esq., in the chair. Mr. T. H. Sutton, The Gardens, Workshop Manor, contributed half-a-dozen splendidly developed pods of *Vanilla*, for which he was voted a Cultural Commendation. The only other exhibits were a dish of Mickleham Pearmain Apples, from Mr. Burnett, The Gardens, Deepdene, Dorking; and a collection of two dozen dishes of Apples and sixteen of Pears, from Mr. G. Goldsmith, of Hollenden.

**Royal Botanic; March 24.**—A considerable number of the good things shown at South Kensington on Tuesday made their appearance here, and consequently the Society's first show of the season was of a higher order of merit than usual, and, favoured by fine weather, it was well attended. Except in the case of *Hyacinths* and *Tulips*, the competitions in the various classes were, as usual at these early shows, not very strong. In the amateurs' class for twelve *Hyacinths* the competitors were Mr. Douglas, gr. to F. Whitburne, Esq., Loxford Hall; Mr. Moorman, gr. to the Misses Christy, Combe Bank; Mr. Boulton, gr. to Captain Patton, St. John's Wood; and Mr. Weir, gr. to Mrs. Hodgson, Hampstead; and the prizes were awarded to the first three in the order named, the competition between the first two being very close, while the exhibits of the third were only of an ordinary description. *Hyacinths*, as a rule, are not of the usual quality this season, nevertheless the plants of both of the first-named growers were an advance in quality on any others shown. The varieties exhibited by Mr. Douglas were *De Candolle*, *Koh-i-noor*, *King of the Blues*, *La Grandesse*, *Macauly*, *Charles Dickens*, *Mont Blanc*, *gigantea*, *Lord Derby*, *Vuurbaak*, and *Grandeur à Merveille*; and most of these sorts figured in Mr. Moorman's stand. In the corresponding class for nurserymen the awards went, in the order named, to Messrs. Gregory & Evans, Sidecup; Messrs. Osborn & Sons, and Messrs. W. Cutbush & Son—the first-named having good examples of *Lord Derby*, *King of the Blues*, *Koh-i-noor*, *De Candolle*, *La Grandesse*, and *Macauly*. For a dozen pots of *Tulips* (amateurs), Mr. Douglas also came in 1st with admirable speci-

mens of *Kaiser Kroon*, white *Joost van Vondel*, the best of its section, *Proserpine*, and *Vermillon Brillant*. Mr. Boulton came in a good 2d, and Mr. James Weir 3d. Messrs. Gregory & Evans also took the lead amongst nurserymen in a similar class, showing large and fine flowers of the red *Joost van Vondel*, *Vermillon Brillant*, *Proserpine*, and *Kaiser Kroon*. Messrs. Cutbush & Son were 2d, and Messrs. Osborn & Sons 3d. Mr. James Douglas and Messrs. Cutbush & Son were respectively 1st and 2d in a class for twelve pots of *Narcissus*, the varieties staged by the former being *Gloriosa*, *Grand Monarque*, *Queen of the Netherlands*, and *Brilliant*. None of them were so strong and well flowered as usual. Mr. Douglas was also awarded the 1st prize for half-a-dozen of the finest *Deutzias* that have probably ever been shown, the plants being dense bushes, about 3 feet high, from 2 to 3 feet in diameter, and densely flowered. The highest award for six hardy *Primulas* also went to the Loxford grower, who had *P. Monroi*, *P. denticulata purpurea*, *P. nivalis*, *P. cortusoides amoena lilacina*, *P. vulgaris Purity*, a good white, and *P. vulgaris platypetala*, a good double lilac. For six *Amaryllis* Mr. J. Wiggins, gr. to H. Little, Esq., Billington Place, took the highest award with four unnamed varieties, a seedling named *International*, and a variety named *Panorama*. Mr. Wiggins had also the 1st prizes in an open and an amateurs' class respectively, for a dozen *Cyclamens* of excellent quality. For six *Primulas* Messrs. Gregory & Evans were well 1st, and Mr. Wiggins 2d; and Mr. Boulton had the 1st prize for a dozen pots of *Crocuses*. Stove and Greenhouse Flowering plants were, as usual, but poorly represented. For twelve, Mr. G. Wheeler, gr. to Louisa, Lady Goldsmid, was 1st, having amongst others a well flowered *Azalea concinna*, a nice plant of *Erica Lindleyana*, and a small well flowered bush of the neat little white flowered *Leucopogon Richei*, a subject not often seen at exhibitions. The 2d prize went to Mr. J. Bristowe, gr. to J. Donner, Esq., Wood Hall, Dulwich. For six *Azaleas*, Mr. Rattray, gr. to R. Thornton, Esq., The Hoos, Sydenham, came in 1st with a neat set of standards; and for six forced *Roses* in pots Messrs. Paul & Son, of Cheshant, the only exhibitors, were awarded the highest prize for a well bloomed lot of small specimens, consisting of *Duke of Edinburgh*, *Anna Alexieff*, *Madame Lacharme*, *La France*, and *Alba rosea*.

The miscellaneous class was, as usual, a heavy one, and included contributions from most of the leading trade growers. Messrs. James Veitch & Sons contributed a good bank of *Hyacinths*, a fine selection of *Amaryllis*, and several new plants. Mr. B. S. Williams and Mr. William Bull each exhibited the choice collections of plants staged by them at Kensington on Tuesday; and Captain Patton showed the same collection of *Hyacinths*, *Tulips*, *Spiraeas*, and *Dicentras*. Messrs. Gregor & Evans, of Sidecup, had a nice group of decorative *Pelargoniums* and *Cinerarias* of good market quality; and Messrs. William Paul & Son, of Waltham Cross, sent eight boxes of cut blooms of *Camellias*, which included samples of a great many varieties. Messrs. W. Cutbush & Son had a group of *Tulips*, and another one of *Lily of the Valley*; and Messrs. Paul & Son, of Cheshant, showed a pleasing group of small pot *Roses* and *Ghent Azaleas*. To all of the above extra prizes of various values were awarded.

#### NEW PLANTS CERTIFICATED.

Botanical Certificates of Merit were awarded to Mr. William Bull for *Polystichum viviparum*, a West Indian evergreen species, with stout, shining dark green fronds and a neat habit of growth; and for the new golden variegated *Selaginella Kraussiana aurea*. To Messrs. James Veitch & Sons, for *Tradescantia Madame Legueuse*, a pretty silvery variegated plant of the *T. zebra* type. To Mr. B. S. Williams for *Anthurium Scherzerianum semi-plenum*, the new semi-double chaste-looking spathed variety; and for a fine plant of the *Cœlogyne ocellata maxima*. Floral Certificates of Merit were voted to Messrs. James Veitch & Sons for *Amaryllis* Iris, a fine reddish-crimson flower; for *Amaryllis* Emilia, greenish-white, heavily suffused with crimson, a well-formed flower of the *Leopoldi* type; for *Amaryllis* Princess Augusta Victoria, a large and fine flower, white, faintly lined with deep rose; for *Amaryllis* Duchess of Connaught, a good pure white of medium size; for *Amaryllis* Thalia, crimson, shaded with deep blood-red, large in size, and good in form; for *Cineraria* Mr. Thomas Lloyd, a remarkably fine double blue-flowered variety; for *Hyacinth* Queen of the Yellows, the best of its class, both in size, colour, and form; for *Hyacinth* Distinction, a pleasing and welcome addition to the type of dark reddish-claret coloured varieties; for *Hyacinth* Captain Boyton, a striped porcelain-blue, but not so clear as it might be; and for *Hyacinth* Cavaignac, a grand single porcelain-blue, having a fine spike and bells of great size, good substance, and undeniably good form. To Mr. Kale, nurseryman, Godalming, for *Chorozema aurea floribunda*, a very fine, free-flowering, greenhouse plant, the flowers pure yellow with white

wings. To Mr. B. S. Williams for *Amaryllis* Exquisite, scarlet banded with white, and of beautiful shape. To Mr. Wiggins, gr. to H. Little, Esq., for *Amaryllis* International, dark blood-red with white venation; and for *Primula sinensis* var. *Meteor*. To Captain Patton for *Hyacinth* Lady Headley, a pretty peach-coloured flower of great promise; and to Mr. H. B. Smith, of Laling Dean, for *Cyclamen* Rosy Morn and *C. picturatum*—the former a bright shade of rose, the latter a delicate blush, both with crimson centre, and both large in size.

**Bristol Spring Show: March 17 and 18.**—The tenth spring exhibition was held at the Victoria Rooms, and proved a decided success. *Hyacinths* and other spring bulbs were present in great force, intermixed with enough larger plants to give variety and impart interest to the whole. The Treasurer, W. Derham, Esq., gave a handsome Silver Cup as a special prize for twenty-four *Hyacinths*, not less than eighteen varieties, and twelve pots of *Tulips*, six double and six single (amateurs). For this there was a close competition, and H. C. Miles, Esq. (gr., Mr. Perry), came in 1st with an evenly flowered, well managed lot of plants. W. Butler, Esq., who was 2d, had also a very meritorious group, his flowers being somewhat smaller. In the class for twelve *Hyacinths*, not less than six varieties, the best flowers in the exhibition were shown. W. Fox, Esq., was 1st, his best flowers being *Lord Derby* (single blue), *Lord Macaulay* (single red), *Von Schiller* (single red), *Alba maxima* (single white), and *De Candolle* (single lilac). C. Taggett, Esq., and G. Webley, Esq., were equal 2d. For twelve *Hyacinths*, consisting of blue, white, dark red, and light red, three of each, Mr. Butler was 1st and Mr. Taggett 2d. F. Owen, Esq., came in 1st for six. *Tulips* were largely shown and excellent in quality. For four pots of single varieties Mr. Taggett took the 1st prize and Mr. Butler the 2d.

An immense number of plants were exhibited in a dozen classes devoted to *Hyacinths*, *Tulips*, and *Narcissus*, which were well represented, and collectively made a very fine show. Messrs. Garaway, of the Durdham Down Nurseries, Bristol, exhibited, not for competition, over 200 *Hyacinths*, which in themselves were a comprehensive exhibition of this popular spring flower, the plants being very well grown and bearing stout compact spikes, all quite fresh and just to the day; they consisted of the best, well-proved kinds, as well as some not so generally grown.

In the class for collections of miscellaneous plants, Mr. H. C. Miles was a long way to the front with a very fine group, the flowering subjects in which were *Orchids*, *Azaleas*, *Cyclamens*, and *Cinerarias*, intermixed with *Dracenas*, *Ferns*, and other ornamental leaved plants. Amongst the *Orchids* were *Phalaenopsis Schilleriana* carrying over seventy very finely marked flowers; *Helleborus humilis*, *Angrecum sesquipedale*, *Lycaste Skinneri*, *Sophranites grandiflora*, *Odontoglossum Hallii*, *O. crispum*, *Cypripedium Boxalli*, *C. villosum*, *Calanthe vestita*, *Dendrobium Wardianum*, *D. densiflorum*, *D. limbriatum oculatum*, *D. Pierardi latifolia*, and a remarkable plant of *D. lituiflorum*. Messrs. Maule & Son, Bristol, were 2d, with larger plants, including *Dendrobium Wardianum*, *D. macrophyllum*, *D. Farmeri*, *Cypripedium villosum*, 2 feet across; and well-flowered *Cœlogyne cristata*, *Vanda suavis*, with *Tree Ferns*, *Palms*, and others of similar character.

In the class for miscellaneous collections of plants in flower Mr. Miles was again 1st, showing a nice group in which were several *Azaleas*, the red-flowered *Darwinia Hookerii*, *Abutilons*, &c. With a single *Orchid* Mr. Miles was again 1st, showing a large and finely-flowered *Cœlogyne cristata*; Messrs. Maule & Son came in 2d with *Cypripedium villosum* bearing twenty-four flowers. For a single hard-wooded plant Mr. Miles took another 1st prize with a nicely bloomed example of *Darwinia tulipifera* about 2½ feet through; the flowers were fully expanded, giving evidence of the lengthened season that this very distinct and handsome plant can be had in bloom.

Messrs. Maule & Son were 1st for half-a-dozen forced hardy hard-wooded plants in flower with *Ghent Azaleas*, *Azalea amoena*, and a fine example of *Tree Peony* bearing a number of large blush flowers which were very attractive.

*Azaleas* were staged in considerable quantities, mostly small or medium-sized plants nicely flowered. There was a good display of *Ferns*, principally confined to the smaller growing species. *Primulas* were remarkably well done, the 1st prize plants especially being noticeable for their size, healthy foliage, and immense quantity of flowers, and the white varieties as they should be, pure in colour. 1st, Mr. H. St. V. Ames was the exhibitor. *Cinerarias* also were well grown and finely bloomed, but, as is too often the case now, were deficient in light-coloured varieties. In the class for fine-leaved plants Mr. Derham took the lead with an even, well-matched group, in which the most noticeable were *Crotons Weismanni* and

majestic. Messrs. Parker & Bush, St. Michael's Hill Nursery, Bristol, exhibited a large and varied collection of well-grown fine-leaved and other plants, which, combined with the many other exhibits of a similar character, gave sufficient relief from the even flat surface presented by such an immense display of Hyacinths and other similarly low-growing things.

Cut flowers, as usual here, were forthcoming in plenty and well arranged. The Mayor's special prize, offered for the best arranged vase or stand, was won by Mr. Hookings, who also secured the highest award. In the Society's corresponding class Mr. C. Fisher took a 1st prize for twelve cut Roses, with flowers such as are seldom seen at this early season, being large and finely developed, mostly Tea varieties, the best of which were Catherine Mermet, Madame Falcot, Devoniensis, and Niphetos. Mr. Fisher also received an extra prize for a box of twenty-four, consisting of similar kinds. S. Gibson, Esq. (gr., Mr. Miller), was first for a single bunch of Grapes with Gros Colmar, very well shown, Mr. Burgess, 2d, having Lady Downe's.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 24, 1880.

March 18.—A beautifully fine day. Cloudless Cold with hoar-frost in morning.  
 — 19.—Cold and dull in early part of morning. Fine and bright afterwards. Overcast at night.  
 — 20.—A fine bright day. Cold. Cloudy at night. Foggy and misty till 11 A.M.  
 — 21.—A fine bright day. Cold. Overcast at midnight.  
 — 22.—Dull and cloudy till evening, then cloudless. Cold.  
 — 23.—Dull till 11 A.M., fine and bright afterwards. Cloudless after 3 P.M. Very cold at night.  
 — 24.—A fine bright day, sky clear. Very cold early morning. Hoar-frost.

LONDON: *Barometer*.—During the week ending Saturday, March 20, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.32 inches at the beginning of the week to 30.04 inches by the night of the 16th, increased to 30.40 inches by the night of the 18th, decreased to 30.28 inches by the afternoon of the 20th, and increased to 30.32 inches by the end of the week. The mean reading for the week at sea level was 30.25 inches, being 0.07 inch below that of the preceding week, and 0.22 inch above the average.

*Temperature*.—The highest temperatures of the air observed by day varied from 58½° on the 19th to 45½° on the 14th; the mean value for the week was 51½°. The lowest temperatures of the air observed by night varied from 31° on the 20th to 38¼° on the 14th; the mean value for the week was 34½°. The mean daily range of temperature in the week was 17°, the greatest range in the day being 24¼°, on the 19th, and the least 7¼°, on the 14th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—14th, 41.3°, +0°.1; 15th, 41°.7, +0°.3; 16th, 40°, -1°.5; 17th, 43°.1, +1°.5; 18th, 43°.1, +1°.4; 19th, 44°.5, +2°.8; 20th, 38°.6, -3°.1. The mean temperature of the air for the week was 41°.8, being 0°.2 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 130¼° on the 17th, 129° on the 18th, 119¼° on the 19th, and 106° on the 16th; on the 14th the reading did not rise above 55°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 27½° both on the 18th and 20th, 30½° on the 19th, and 31° on the 16th; the mean of the seven lowest readings was 31°.

*Wind*.—The direction of the wind was E. and N.E., and its strength strong.

The weather during the week was fine, bright, and dry. The mornings were very cold, likewise were the nights. A fog or mist prevailed during the early part of the morning of the 20th.

No rain fell.

ENGLAND: *Temperature*.—During the week ending Saturday, March 20, the highest temperatures of the air observed by day were above 57° at Truro, Blackheath (London), Leicester, Cambridge, and Nottingham, and below 50° at both Norwich and Leeds; the mean value from all stations was 54½°. The lowest temperatures of the air observed by night were below 26° at Leicester, Cambridge, Wolverhampton, and Nottingham, and above 38° at both Truro and Plymouth; the general mean from all places was 30¼°. The extreme range of temperature in the week was above 31° at Leicester, Cambridge, and Nottingham, and below 17° at Plymouth and Brighton; the mean range from all stations was 24°.

The mean of the seven high day temperatures was above 52° at Truro, Bristol, Leicester, and Cambridge, and below 47° at Norwich, Sheffield, and Bradford; the mean value from all places was 50°. The mean of the seven low night temperatures was below 34° at Leicester, Cambridge, Wolverhampton, Nottingham, and Sheffield, and above 41° at Truro and Plymouth; the mean from all stations was 35¼°. The mean daily range of temperature in the week was above 10° at Leicester and Cambridge, and below 10° at both Truro and Plymouth.

The mean temperature of the air for the week from all stations was 41½°, being ½° lower than the value for the corresponding week in 1879. The mean temperature of the air for the week was above 45½° at Truro and Plymouth, and below 40° at Cambridge, Norwich, Wolverhampton, and Sheffield.

*Rain*.—Very little rain was measured during the week; at Plymouth 0.28 inch fell, and at Truro 0.11 inch fell, but at most other places no rain was measured; the average fall over the country was but three-hundredths of an inch.

The weather during the week was generally fine and dry, with cold mornings and nights. A little fog prevailed at some places on March 14.

SCOTLAND: *Temperature*.—During the week ending Saturday, March 20, the highest temperatures of the air observed by day varied from 57° at Glasgow to 50° at Leith; the mean value from all places was 53½°. The lowest temperatures of the air observed by night varied from 27¼° at Aberdeen, to 31¼° at Greenock; the mean value from all stations was 29°. The mean range of temperature in the week from all places was 24½°.

The mean temperature of the air for the week from all stations was 40¼°, being 4¼° higher than the value for the corresponding week in 1879. The mean temperature was the highest at Glasgow, 43¼°, and the lowest at both Edinburgh and Leith, 39¼°.

*Rain*.—The amounts of rain measured during the week were very small. At Dundee 0.05 inch was measured, and at Aberdeen 0.03 inch fell; the average fall over the country was 0.02 inch only.

JAMES GLAISHER, F.R.S.

## Florists' Flowers.

SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS.—AURICULAS.—So far these charming spring flowers have made wonderful progress without any check to their development. Last year we were glad to place the whole of the plants into a house where they obtained artificial heat: this season they do not require this, but are nearly all in the cold frames. A few of those that are apt to come with cupped pips have been placed in the house, as also such that take a long time to open. Some varieties have their flowers open in two weeks after the pips can be discerned, others take five or six weeks. See p. 270 as to airing and shading the frames. The air is very frequently dry in April, and as the pots are quite full of roots the soil speedily becomes exhausted of moisture, so that it will be necessary to look over them every day; indeed there is something always required to be done to the plants in April. When there is more than one truss, the others must be removed, but it must be done by picking off the pips merely; the flower-stems must not be taken off, else the portions remaining will rot, engender mould in the centre of the plant, and probably kill it. The trusses nearest the base of the plants are usually the best.

CARNATIONS AND PICOTEES.

April is rather a critical month. The plants are in their flowering pots by the end of March at the latest. It is desirable to keep the plants in cold frames as long as it is possible to do so after they are

potted, as frosts at night, cold east winds by day, and rough weather, which may be expected even in April, seriously cripple the plants. I well remember the late Mr. N. Norman saying to me, in reference to this, "You cannot give your plants too much glass in the spring. Give them plenty of glass." These were as nearly as possible his own words, and he made this class of plants his life study. How he would have enjoyed the great Carnation and Picotee exhibitions held during the last two or three seasons! This is the month to sow seed. Fill the pots or pans to within 2 inches of the surface with the ordinary potting material, the top portion to be fine loam and leaf-mould with a little sand; in this sow the seeds just covering them over. Plunge the pots in a frame with a little bottom-heat, the seeds will vegetate more freely and sooner in heat; but if this is not available the pots may be placed in a cold frame.

DAHLIAS.

Pot roots should be started at once in a gentle heat if this has not yet been done. Shake the soil from the roots as soon as the eyes have been started, and repot the plants in 3-inch pots. Pot off rooted cuttings as soon as they are ready, and still propagate those varieties of which there is not yet sufficient stock. Earlier potted plants may be placed in a cold frame, but mats must be thrown over the glass at night. Sow seeds in heat, in the same way as in the case of Carnations.

GLADIOLI.

It is now quite time that the general collection was planted out. Instructions have already been given how this should be done. Such weather as we are now enjoying suits these plants well. They can be planted out in dry weather, and the ground is also in a good state to receive the corms. Sow seeds at once. I sow about thirty seeds in a 7-inch pot; at least twenty-five plants on an average will come up in each pot, and that is a sufficient number to give each a chance to form a good corm by the end of the season. One frame will do for these, for Dahlias, Hollyhocks, Carnations, &c.

HOLLYHOCKS.

The instructions are similar to those given last month. Continue to pot off late propagated plants, and gradually inure them to the outer air. Plant out the earliest potted plants if they are quite ready, and encourage the late plants to make plenty of roots, to be planted out for successional bloom. Fork the ground over where the late plants have to be put out; the surface cannot be stirred up too often. J. Douglas, Loxford.

## Enquiries.

He that questioneth much shall learn much.—BACON.

AARON'S ROD.—What is the scientific name of the plant commonly called Aaron's Rod? T. C. H. [We have heard the Almond and the Golden Rod (Solidago) so called, but the authorities are silent upon the point. Can any of our readers answer the question? Eds.]

PURPLE MELIC GRASS (MELICA CERULEA).—I am very much interested in the culture and utilisation of this plant, and beg to propose the following questions in the hope of obtaining information:—1. How is it best propagated, or increased for planting? 2. How should it be planted? 3. I have obtained seeds of it in quantity, and at considerable expense, but the trial sowings of these are somewhat unsatisfactory. How should they be started or raised? 4. In the West of Ireland I see by a circular that a 10-acre plot of bog-land has been prepared for its growth. Is bog-land the best on which to plant the Melic? 5. Would any manurial stimulants increase the growth of the plant, and length of culm? If so, what manure or compound is best? 6. Any practical information from gentlemen interested in the growth and development, or utilisation, of this indigenous grass would be thankfully accepted. Ebor.

## Answers to Correspondents.

BONE-DUST AS MANURE: Q. Hunter, the famous surgeon and anatomist, was the first to notice the fertilising properties of bone-dust; but to Dr. Erasmus Darwin, the famous author of *The Botanic Garden*, and grandfather of Mr. Charles Darwin, is the credit due for first explaining its merits theoretically, and bringing it forward with authority. See the Introduction, by Mr. Charles Darwin, to Krause's *Life of Erasmus Darwin*, p. 113.

ERRATUM.—In Dr. Siemen's letter at p. 363, col. 4, for shillings read pence, with reference to the expense per hour.

FORCING SEEDS: John Luke. Probably the article you enquire about is Rippingill's Propagating Frame,

which is sold by the Albion Lamp Company, 118, Holborn, W.C.

**HYACINTH FAILURE:** *G. & W. Y.* The point of the spike, we should imagine, has been killed by cold—probably a downward draught from the window.

**INSECTS:** *J. J. B.* The small blue beetles which fed on your Turnips, Cabbage, Seakale, &c., last year are the *Chrysomela* (*Phædon*) *Betulæ*, which occasionally destroy the crop of Mustard seed in the Eastern Counties. A bag-net drawn over your plants would catch the beetles in large numbers, which should be scalded to death. *I. O. W.—C. W. V.* The little red grubs which are destroying your Raspberry buds are the caterpillars of a small beautiful moth (*Tinea Corticella*, Linn.,—*rubiella*, *Ejerkander*,—*variella*, Fab.). Pick off and burn the diseased buds, or give them a sharp squeeze, to kill the larvæ. Its transformations are figured in *Gard. Chron.* 1853, p. 757. *I. O. W.*

**NAMES OF PLANTS:** *Kinmont & Co.* The variety of *Pteris serrulata* is very near to that known as *fimbriata*, and may come under the same designation.—*Mrs. Maynard.* *Lavandula Stachas*, *Atroplex Habimius*, if a shrub.—*R. Nunn.* The Tulips are ordinary garden varieties, which we cannot pretend to identify. Their names are legion.—*J. M.* Your two Orchids were smashed in the Post-office. You should have sent them in a box strong enough to withstand the pressure to which such packages are subjected in transit.—*J. G. Mitchinson.* One of the forms of *Narcissus odorus*.—*W. B. T.* 7, *Lycaste Skinneri*; 8, *Limatodes rosea*; 9, *Vanda tricolor*; 10, *Phaius Wallichii*; 11, *Odontoglossum Phalænopsis*; 12, *Dendrobium*, not recognised, as the habit is not shown by the sample sent.

\* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. *Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

## Markets.

### COVENT GARDEN, March 24.

Our business in forced goods is now at a standstill, and will be for a week or two, owing to the holidays and dissolution of Parliament—late Grapes and forced Strawberries experiencing a very severe decline. Best outdoor vegetables make high prices, but common sorts are principally cleared by the costermongers. *James Webber, Wholesale Apple Market.*

Potatos.—Regents, 100s. to 140s.; Flukes, 120s. to 160s.; and Champions, 150s. to 190s. per ton. German, 6s. to 7s. 6d. per bag; new English, 2s. per lb.

### SEEDS.

LONDON: March 22.—As might be expected, there is now an active sowing demand for farm seeds; but as regards values no important change is shown. Red Clover seed can now be bought in London at very moderate rates. The quality of the Canadian Clover this season is finer, and the price lower, than ever before. Some good yearling English Cow-grass is also offering at very reasonable figures. Trefoil, without being quotably higher, has lately met with increased favour. White Clover is comparatively scarce and dear. Alsike is unusually cheap. There is no alteration in grasses. Spring Tares, having been scarce and much wanted, advanced during the past week 2s. to 3s. per quarter. Of small Koenigsbergs the supply on the spot seems nearly exhausted. Some good foreign gore Vetches are obtainable on Mark Lane at 49s. per quarter. In Canary seed the tendency is upward. Hemp seed realises 31s. per quarter. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

A steady tone prevailed at Mark Lane on Monday. In Wheat there was very little doing, and rates were much the same at the close as on Monday's night. Barley was rather dull, with rates not over-well supported in the case of inferior qualities. Malt was quiet and unaltered. For Oats prices moved up from 9d. to 1s. per quarter as compared with the previous Monday. Maize was the reverse of plentiful, and quotations were very firm without being higher. Beans and Peas were affected by extreme rates. Flour was taken off to a small extent on former terms.—On Wednesday Wheat changed hands quietly, at barely late rates. Barley was in slow demand on former terms. No change took place in malt. Oats and Maize were tolerably firm, but with a quiet market. Beans and Peas were unaltered. The flour trade was dull and weak.—Average prices of corn for the week ending March 20:—Wheat, 46s. 1d.; Barley, 34s. 11d.; Oats, 23s. 3d. For the corresponding period last year:—Wheat, 40s. 8d.; Barley, 33s. 9d.; Oats, 21s. 1d.

### CATTLE.

At Copenhagen Fields on Monday trade in beasts was not very brisk, yet there was a fair demand for choicest qualities at rather over the quotations of Monday's night. For sheep the demand was good, and prices higher. Choice lambs were scarce and very dear. Calves also fully maintained late rates.—Quotations:—Beasts, 4s. 4d. to 5s. 2d., and 5s. 6d. to 6s.; calves, 5s. 6d. to 6s. 8d.; sheep, 5s. 4d. to 5s. 8d., and 6s. 4d. to 6s. 6d.; pigs, 3s. 6d. to 5s.

### HAY.

Tuesday's Whitechapel Market report states that the best fodder met with a steady inquiry, but there was not much sale for inferior sorts. The supply was moderate.—Prime Clover, 110s. to 132s.; inferior, 70s. to 100s.; prime meadow hay, 90s. to 100s.; inferior, 50s. to 80s.; and straw, 30s. to 38s. per load.—Cumberland Market quotations:—Superior meadow hay, 100s. to 110s.; inferior, 40s. to 75s.; superior Clover, 120s. to 130s.; inferior, 80s. to 100s.; and straw, 36s. to 40s. per load.

### POTATOS.

From the Borough and Spitalfields Markets reports we learn that Potatos have been in fair demand, and the better descriptions have been firm in price. The arrivals continue on a moderate scale. Scotch Regents, 140s. to 160s.; Lincoln Champions, 175s. to 185s.; Scotch ditto, 170s. to 180s.; Victorias, 160s. to 180s. per ton. German reds, 6s. 6d. to 8s. 6d.; Dutch rocks, 5s. 6d. per bag.—During last week 165,960 bags were received at London from Hamburg, 19,745 Bremen, 7526 Stettin, 1430 Antwerp, 2156 Colberg, 1101 Ghent, 1168 Harlingen, 7243 Harburg, 2708 Rotterdam, 2468 bags 1279 sacks Boulogne, and 1210 bags from Malta.

**Government Stock.**—The closing price on Monday of Consols, for delivery, was 97½ to 98, and for the account, 98 to 98½. On Tuesday the price for delivery was unchanged, but for the account the closing figures were 97½ to 98½. On Wednesday Consols left off at 98 to 98½ for both delivery and the account.

*The Manufacturers of this valuable Manure have hitherto thought it best not to publish Testimonials, as they have particularly wished that no exaggerated statements should appear respecting it. They consider, however, that the opinion of the well-known Florists, Messrs. J. & J. Hayes, of Edmonton—than whom there are no better Plant Growers in England—will be considered of especial value:—*

"Dear Sirs,

"We have been using Clay's Fertiliser largely for some years, and are pleased to say that we consider it by far the best Manure we have ever tried.

"J. & J. HAYES."

Hurry's Daisy and Weed Extractor,  
FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little invention.

The following particulars, from the *Gardeners' Chronicle* of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of Mr. ALFRED F. O'C. HURRY, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

**HELLIWELL'S PATENT SYSTEM of IMPERISHABLE GLAZING WITHOUT PUTTY, INDIARUBBER, or CEMENT.**

It is adopted by H.R.H. the Prince of Wales. Highest Award at Fine Art Exhibition, York.

No outside painting required, and it is easily repaired by even inexperienced workmen.

"Bank Chambers, Norwich, October 24, 1879."  
 "T. W. Helliwell, Esq., Brighouse.—Sir,—I went yesterday and examined the Glass Roof Glazed by you, under my directions, at Sandringham, for His Royal Highness the Prince of Wales, and found it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can.—Believe me, yours faithfully."  
 "C. SMEDLEY BECK, Architect."

Monthly, 1s. W. KENT AND CO., 23, Paternoster Row, London, E.C.

In 1 vol., 8vo., with above 12,000 Woodcuts, price 42s., LOUDON'S ENCYCLOPEDIA of PLANTS: comprising the Specific Character, Description, Culture, History, Application in the Arts, and every other desirable particular respecting all the Plants indigenous to, cultivated in, or introduced into Britain. Corrected by Mrs. LOUDON; assisted by GEORGE DON, F.L.S., and DAVID WOOSTER. "This celebrated work is of nevertheless drawn by Mr. the greatest utility to garden-ers, and, indeed, to all who have not access to great libraries. The great recommendation of the work has always been its woodcuts, which, although only miniatures, were nevertheless drawn by Mr. Sowerby with such happy art, and so skilfully engraved by Erastus, that the plants could always be recognised, even by those little acquainted with the vegetable kingdom."—Gardener's Chronicle. London: LONGMANS AND CO.

In 8vo., with several hundred Woodcuts, price 21s. LOUDON'S ENCYCLOPEDIA of GARDENING; comprising the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening. London: LONGMANS AND CO.

**KINAHAN'S LL WHISKY.**

Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

**EPPS'S COCOA.**

**GRATEFUL AND COMFORTING.**

JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,** and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S OINTMENT and PILLS.**

—Diseases of Women.—Medical science in all ages has been directed to alleviate the many maladies incident to females, but Professor Holloway, by diligent study and attentive observation, was induced to believe that Nature had provided a remedy for these special diseases. He has, after vast research, succeeded in compounding his celebrated Pills and Ointment, which embody the principle naturally designed for the relief and cure of Disorders peculiar to Women of all ages and constitutions, whether residing in warm or cold climates. They have repeatedly corrected disordered function which had defied the usual drugs prescribed by medical men, and still more satisfactory is it that the malady is relieved completely and permanently.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

## NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

### Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady	
To cut 8 inches	2 10 0
Can be worked by a Lady.	
To cut 10 inches	3 10 0
Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

### Double-handed Lawn Mower.

To cut 16 inches	Price £6 15 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
*To cut 22 inches	8 10 0
* If made stronger, suitable for Donkey, 30s. extra.	
*To cut 24 inches	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

#### DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

#### HORSE MACHINES.

To cut 35 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Diam. Length	£ s. d.	Diam. Length	£ s. d.
16 in. by 17 in.	2 15 0	24 in. by 20 in.	5 0 0
20 in. by 22 in.	4 0 0	30 in. by 32 in.	9 0 0

#### PRICE OF ROLLERS IN TWO PARTS.

Fitted with Shafts for Pony or Horse.

Diam. Length	£ s. d.	Diam. Length	£ s. d.

Elvaston Nurseries, Borrowash, Derby.

Wandsworth Common and Garret Lane Nurseries. R. AND G. NEAL beg to call the attention of Gentlemen, Builders, and the Trade to their large and varied Stock of HARDY ORNAMENTAL, FOREST, FRUIT TREES, ROSES, SHRUBS, &c., grown at their Nurseries, which comprise 70 Acres of a remarkable collection of those Plants and Trees most suitable for growing in or near large towns. An early inspection is solicited. All goods delivered free on rail in London or at own residence within six miles of the Nurseries. CATALOGUES free by post on application.

New Catalogue for 1880. W. M. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their DESCRIPTIVE PRICED LIST upon application. Their stock of Florists' Flowers, Bedding and Soft-wooded Plants generally, is surpassed by none either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to purchasers is that none of the Plants offered are taken from a warm propagating-house and sent off immediately, but are all carefully hardened, and most of them potted off singly, and are thereby fitted for transit by post or rail without the slightest injury. A great proportion of the under-mentioned are autumn-struck plants, and can be had in pots if required, and all in a variety of sorts and colours, all good for exhibition or home decoration:— Our Selection. Per doz.—s. d. Achimenes, in variety .. 3 0 Ageratum, small plants, per 100, 5s. .. 1 0 Ageratum, in pots, per 100, 15s. .. 2 6 Antirrhinum .. 3 6 Begonia, Tuberous, from 4s. to .. 18 0 Other sorts .. 3 0 Bouvardia, 4s. to .. 6 0 Caladium .. 9 0 Calceolaria Golden Gem (not in pots) per 100, 5s. 1 0 Carpet Bedding Plants (see Catalogue) Carnations and Picotees, 12 plants .. 7 0 12 pairs .. 12 0 Chrysanthemums, in great variety, per 100, 18s. .. 3 0 Clematis, to name .. 9 0 Coleus .. 3 0 Dactylis elegantissima, per 100, 6s. .. 1 0 Dahlias, per 100, 20s. .. 3 6 Delphiniums .. 6 0 Epiphyllum .. 9 0 Ferns, Stove and Green-house, 6s. to .. 9 0 Fuchsias, per 100, 18s. 3 0 Gardenia florida .. 6 0 Greenhouse Plants .. 9 0 Geranium bicolor .. 3 0 Geranium, Silver-edged .. 3 6 Geranium, Double .. 3 0 Geraniums for Bedding .. 3 0 Geraniums, for pot culture, 3s. to .. 6 0 Gladiolus, splendid seedlings, per 100, 20s. .. 3 0 Gladiolus Brechleyensis, per 100, 6s. .. 1 0 Gloxinias, 6s. and .. 9 0 Hardy Climbing Plants, in great variety, 6s. .. 9 0 Hollyhocks, Seedlings .. 4 0 Helianthemus .. 2 6 Herbaceous Plants, per 100, 20s. .. 3 0 Heliotropes .. 2 6 Hepaticas .. 4 0 Iresine Lindeni, per 100, 10s. .. 2 0 Iris, German .. 3 0 Ives, in variety .. 6 0 Ives, Irish .. 3 0 Lactianas .. 2 6 Lilium auratum, very fine, each, 1s. and 1s. 6d. Lobelias, small, per 100, 4s. .. 1 0 Lobelias, in pots .. 2 6 Dwarf-trained, 18s. to .. 30 0 Cuttings of any of the above varieties of the Soft-wooded Plants at half above prices, our selection.

THE BEST PLANTING SEASON. THE LAWSON SEED AND NURSERY COMPANY (Limited) respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition. Where personal inspection is not convenient, special offers will be made, and CATALOGUES sent on request.

Lawn Mowers — Lawn Mowers.

THE GREAT SUPERIORITY OF  
**GREEN'S PATENT "SILENS MESSOR"**  
AND  
**"MONARCH" LAWN MOWERS**

Over those of all other Mowers is universally acknowledged. **Either Short or Long Grass, Bents, &c., Wet or Dry.** These advantages no other Lawn Mowers possess. They have been in constant use for upwards of twenty years in **The Royal Gardens, Windsor,**

Buckingham Palace Gardens, The Hyde Park Gardens  
Marlborough House Gardens, Hampton Court Gardens  
Royal Horticultural Society's Gardens, The Zoological Gardens, Regent's Park  
The Royal Botanic Gardens, The Dublin Botanic Gardens  
The Crystal Palace Company's Gardens, The Laverpool Botanic Gardens  
The Winter Palace Gardens, The Botanic Gardens, Brussels  
Dublin, The Leeds Horticultural Gardens

And in most of the Principal Parks and Squares in the United Kingdom.

They are the simplest in construction, the easiest to work the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant. The above machines have proved to be the best, and have carried off Every Prize in all cases of Competition. Every Lawn Mower is guaranteed to give entire satisfaction, otherwise it may be returned at once, free of cost to the purchaser.

The largest stock of Mowers kept in London, and including all sizes from 6 inches to 48 inches, is to be seen at our London establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, and have their orders executed the same day they are received.

24 "	"	9 0 0

Prices of Horse, Pony, and Donkey Machines, on application. They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the manufacturers. Carriage paid to all the Principal Railway Stations in the United Kingdom. Illustrated Price LISTS free on application. N.B.—Those who have Lawn Mowers to Repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

**GREEN'S PATENT ROLLERS**

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths. SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Prices of Rollers fitted with Shafts, suitable for Horse and Pony, on application. They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers, **THOMAS GREEN AND SON (Limited), SMITHFIELD IRONWORKS, LEEDS.** And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E. Carriage of Rollers Paid to all the Principal Railway Stations in Great Britain.

By Permission of the Hon. Board of Customs. (Free of Duty.)

**CORRY & SOPER'S NICOTINE SOAP** (PATENT).

An effectual and speedy Eradicator of Scale, Thrips, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting Plants, without injury to Foliage.

It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars. Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is Nicotina, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with **Perfect Safety to Foliage.**

It may be used as a Dip or Wash for any description of out or indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from some hundreds lately received from men of considerable experience:—

Messrs. J. & J. HAYES, Nurserymen, Edmonton, London, N., on Feb 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who have anything to do with plants or fruit growing, as it is so very useful for dipping and syringing when it is not convenient to fumigate. You are quite at liberty to make what use you please of this."

Messrs. OSBORN & SON, The Fulham Nurseries, London, write:—

"We have given your Nicotine Soap a fair trial, and our experience confirms the character you give it, that it is an unrivalled preparation for killing insect life, without injury to plants."

Mr. B. MALLER, Royal Ash Nursery, Lee, London, S.E., on Feb. 21, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must now say it is very satisfactory. I am now having it used freely for syringing, ½ pint to 4 gallons of water, without the least injury to the foliage."

Mr. J. C. SWEERS, Orchid Grower to Sir Trevor Lawrence, Bt., Fawford Lodge, Dorking, on Nov. 24, 1879, writes:—

"I have now tried in many ways your Nicotine Soap as an insecticide for Orchids, and it has given me great satisfaction," &c.

Messrs. BARNWELL & TILBURY, Nurserymen, Worthing, on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we can with pleasure say it is the most useful insecticide that has ever come under our notice. We have tried it on Strawberry plants when in bloom, and find it most effectual in destroying the fly, whilst it does not in the least injure the plants or flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ABBEY, Gardener to C. M. Palmer, Esq., M.P., Grenke Park Garden, Saltburn-by-the-Sea, on February 20, 1880, writes:—

"The Nicotine Soap I had from you I find a safe and powerful insecticide, being destructive of every kind of insect infesting plants, and in no instance has any injury been done to the foliage. At a strength of 3 oz. to a gallon of water, I have used it for syringing Peaches during growth for the destruction of red-spider, without injury in any way (only to the insect which it instantly kills). At that strength to 4 oz. to the gallon it may, with perfect safety, be employed for syringing every description of fruit tree, whether under glass or outdoor, and a majority of plants, without the least injury, whilst at the same time it destroys aphides—green, brown, blue, and black—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon of water, I have employed it very successfully for destroying mealy-bug, brown and white scale, both by syringing the plants and applying with a brush, its effects upon the insects making its application gratifying; whilst from its grateful smell, it is pleasant than otherwise. At a strength of 8 oz. to the gallon, I found it a first-rate winter dressing for fruit trees, mealy-bug on Vines, as well as a destroyer and preventive of red-spider, thrips, and aphides. It also destroys American blight."

The following Nurserymen authorise us to say they have used the Nicotine Soap with unqualified satisfaction:—

J. Laing & Co., Forest Hill, London, S.E.; Hawkins & Bennett, Twickenham, S.W.; G. Edwards, Balham, S.E.; James Walton, Lee, S.E.; D. S. Thomson, Wimbledon, Surrey; F. & A. Smith, Dulwich, S.E.; J. Peed & Son, Rouppell Park, Lower Newwood, S.E.; G. Brand, Winchmore Hill, N.; Hooper & Co., Covent Garden, W.C.; Lucombe, Pince & Co., Exeter; Edw. Corling, Derby; T. Frost & Sons, Maidstone; W. C. Drummond, Bath; G. & W. Yates, Manchester; W. Bryant, Kugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aberdeen; J. Charlton, Tunbridge Wells; Edwison Bros., Dame Street, Dublin, &c.

Sold in jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in tins, 14 lb., price 15s. 6d.; and drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use upon each package.

And 2 oz. sample jars, 6d. each. Full directions for use on each package. Manufacturers of Tobacco Powder, Tobacco Juice (duty free), Tobacco Paper and Cloth, and Horticultural Sundriesmen. May be obtained from all Seedsmen and Florists. Wholesale from the Manufacturers,

tuce; the pretty *Estradæ*, the new *Restrepia Falkenbergii*, and many others. They were potted in peat and sphagnum, and looked nicely finished on the surface. To keep down the raids of slugs they were placed on inverted pots, and had their leaves well up to the glass horizon.

#### No. 2 HOUSE.

This may be said to be the first house of No. 1 range, which stands north and south, and has of course an east and west exposure to the full influence of light, subject of course to the ordinary rules of shading from solar power. It is about 50 feet long by 10 feet wide, with path up the centre and 3 feet tables on either side, built as low as practicable for convenience of walking and for giving head-room to the plants on either side. The stages are slate supported with a framework of iron, over which is a wood lattice-work raised about 6 inches from the slate slabs for resting the pots upon. This gives a space for the disposal of waste water, and with the gravel underneath holds moisture to disperse as the pressure of sun-warmth or pipe-warmth demands. In addition to this, as a feeding moisture-medium, there is a great deep tank about 30 feet long underneath the ground floor, which is an exceedingly valuable help for promoting atmospheric moisture to these greedy moisture-seeking plants. What adds to the general appearance, both path and floor under the stages are laid with encaustic tiles, and are always dry-like and comfortable—the needful moisture being held *in retentis*, as above mentioned, in the space between the lattice-work stage and the slate slabs, together with the great tank underneath all. This, in my opinion, is the best prepared house for cool Orchid culture I ever saw, and one which might advantageously be imitated by any gentleman building such a structure.

Proceeding then to detail, the plants here are quite without a flaw, no matter whether it be *Odontoglossum Alexandræ*, *Andersonianum*, *Pescatorei*, *nebulosum*, *cirrosium*, *maculatum*, *cordatum*, *gloriosum*, *coronarium*, or even *Phalenopsis*. Of the latter it must be known that it is only recently taken from a warmer house to summer along with the others. I presume the batch of *vexillarium* has been also so removed. Speaking of the latter, they are a magnificent lot of about a dozen plants in what might be called specimen size, nearly quite perfect in foliage—two of them particularly conspicuous, and said to be the fine variety of *vexillarium roseum*, which is remarkably scarce. Along with these stands the very rare and beautiful *O. Warszewiczii*, which, like all white Orchids, is greatly admired. The *O. Phalenopsis*, of which there are scores here, are in fine order, none of them very large plants; indeed it is no advantage having this too large, as it builds up its pseudobulbs so much together in the centre as to weaken its power as a flower-producer. Notwithstanding its congeners—which, for the sake of distinction, should be ranked among the section *Euodontoglossum*—it is one of the loveliest of them all. Passing from these, we admire greatly one grand form of *O. Pescatorei*, which Mr. Spyers says yielded 100 flowers to the raceme! This is a giant bulb, with faint tiger-spots; indeed, I have always looked to this species as one of the most admirable of Orchids, it is such a laster, and when in cultivation, such as we have seen it elsewhere, *Trentham* in particular, it has absolutely no rival. *O. Andersonianum* is here in several varieties, one the very fellow which I have noted as *Ruckerianum* elsewhere. It is in several varieties in another house, which shall be noted as we proceed. One very grand form of *O. nebulosum* is flowering: it is the best form of *paradinum* I have yet seen—quite a florist's flower, looking to the segments and the spotting of that rich sienna which is a prominent colour in many Orchids. By far the most striking plant of *O. coronarium* stands *vis-à-vis* to the spotted *nebulosum*. Its wandering rhizomes have taken possession of an oblong box 3 feet long, and its growths have finished off with stronger pseudobulbs than its native-made ones. It has flowered hitherto, and is showing flower raceme again. *O. nævium majus* is also throwing up its charming arching racemes. When in great health and in full florescence this is a most exquisite Orchid: it is just expanding its flowers. A beautiful little fellow for this is *O. roseum*, the one purity itself, the other a captivating ruby. It requires to be seen with a dozen of racemes to show its merits, and it is here fully developed, suspended near the

glass, and in every respect a gem. Among the many *Alexandræ* here we have the type which the late Dr. Lindley evidently had before him in a dried state when he named the species *crispum*. The petals of many of the sorts are very effectively crisped, and some of the tepaline segments are crisped as well, indeed in many of the forms they are uniformly wavy. One variety which I called *crispum album* was particularly noticeable. The whole of its segments were as white as paper, and the lip as well, with the exception of the modulated yellow crest and a crowd of irregular spots at its base. Nor must the much-abused *gloriosum* be omitted, for in several varieties here it is a distinct and estimable subject. *O. Rossii* in its major variety was finely developed, and the ruddy-red rare *Cervantesii roseum* was in bloom. *O. cirrosium*, like a wanderer from home, is a grand Orchid in many of its forms, but its leggy panicles mar much that is beautiful about it. Mr. Spyers avers that it becomes tractable after a few years' culture, assuming the dumpy form which is clearly desirable.

Where all the *Odontoglossum* specially named were doing so well it is very desirable to know the company they keep. Well, first and foremost, *Dendrobium infundibulum* and *Jamesianum* were finding a suitable home in this climate. Many hundreds of these plants have been sacrificed in Indian temperatures, and I am glad to see the plants rescued from duration vile. That they will continue to grow and prosper there is no manner of doubt, as I have proved satisfactorily fifteen years ago, subjecting them to a sunless climate. Another gem which has all but been decimated by submitting it to too great heat is *Pleione humilis*. It is in this climate in perfection, with over a score of flowers—and such flowers, too! with segments of pale lilac softening almost into white, and prominent fringed labellum, with a network of lilac lining and spotting in the interior. This will stand nearly as much cold as a *Disa grandiflora*, and if it is placed in proper temperature in summer any one will see numerous filaments springing up from the bulbils. Then such *Masdevallias* as like a little more winter heat are here, and in great health. *M. Chimera*, *Backhousiana*, with a raceme the remains of which showed it to be five-flowered; *bella*, with its fungus-like labellum, a great beauty; *nycterina*, after the same order, but smaller in every way; the beautiful *Restrepia antennifera*, with a labellum not unlike a punt in form, and of those velvety and Indian-red colours suffused as to make it a veritable gem among the grotesque forms of Orchids. Then splendidly cultivated *Epidendrum vitellinum majus*, in half-a-dozen plants without a spot or speck, brings up the rear of a lot of unexceptionally well cultivated, splendid-looking groups of plants.

#### No. 3 HOUSE.

This may be called an intermediate-house, loftier than No. 2, and about twice its width. Judging by the eye, one would put it about 20 feet square, having a central table, a path all round, and the ordinary side stages. It is finished in the same style in every way as No. 2, only underneath the stages is a groundwork of *Selaginella*. The plants here are meant to rest with their pots on the gravelled slate slabs, but the career of woodlice and their likings for the roots of many Orchids have compelled, not only standing on inverted pots, but these pots again being placed in saucers of water. These pests would require to add to their creeping powers the art of swimming, which is evidently too much for them, as the healthy roots of *Oncidium crispum* bear testimony. Until this was done Mr. Spyers tells me he could not get a healthy root kept entire.

The first plant that attracts attention in this house is an immense *Lælia cinnabarina*. I have seen and grown this species for years, but I never saw a giant like this, and the home bulbs plumped up and larger in dimensions than the native ones—a beautiful variety, too, in flower. The plant would bear thirty to forty pseudobulbs, the biggest of them being like a good-sized Parsnip set on end, but a little more cylindrical in form. This is a handsome growing plant when in vigour like this. *Cattleya Regnelli*, too, was in great style, struck into 10-inch pots with the Fern-blocks on which they had been tied. The very rare and pretty *Epidendrum Wallisii* was in bloom. The plant bears long linear pseudobulbs multitudinously spotted, and at its apex comes a short raceme of yellow-limbed flowers, the lip being broadly ovate, ground colour white adorned with

faint lilac lines. A few *Cypripediums* are grown here, chief among which is *Boxallii*, *Darwinianum*, *Harrisonium*, &c. Chief among *Lælias* is the *elegans* var. *Turneri* in strong plants, one plant of which is very conspicuous from an immense growth which it has finished, which might do duty for a walking-stick—not to a 6-foot Highlander certainly, but to some of the members of the *genus homo* which I have seen walking about since I came to the metropolis. It is remarkable how this very fine type varies in growth; one very excellent plant assumed a good deal of the habit of growth of *C. maxima*, with its leaf erect on the bulb instead of horizontal. *C. Leopoldii*, too, in specimen size and with leaves as stiff as a piece of sole leather, were quite beautiful to look upon; indeed, the whole of the *Cattleyas* and *Lælias* in this house were striking plants. The very handsome *Cœlogyne Lemoineana* was here in specimen size—it differs from its congener *cristata* in having segments much broader, which, instead of being nodding, stand flat with a good lip more lemon than orange crested, and blooms much later than the one to which it is compared. The *Bolleas* in this house were quite a treat to look at, very few being affected with spot or disfigurement of any kind. *Bollea coelestis* as a specimen was a marvel. It filled quite a No. 1 pot, and its leaves were as strong as a finely grown *Calanthe veratrifolia*. This and the bluetipped *B. Lawrenceana* were in grand order, and so were many of the *Pescatoreas* with which they were associated.

Up above these was a splendid pair, one in particular, of *Cypripedium superbiens* or *Veitchii*. This is a grand slipper, not too frequently seen in fine condition. *Miltonia cuneata*, with its clean-looking labellum and its sienna-blotched segments, was finely in flower. What struck me much was the excellent style in which *Oncidium crispum*, *Gardnerianum*, and *Marshallianum* were cultivated. Every one knows how difficult it is to get rid of that pulpy orbicular spot that attacks the leaves. In one or two instances here it is entirely absent, and the young growths are forming into bulbs larger than the native ones. This is due, looking to the plants, to keeping them in limited pot space, and in conserving the roots from wood-lice in the manner already detailed. Another group of plants alongside of these was *Vanda cœrulea*, and if anything merits compliment these plants do—they are the picture of health, growing on Teak-rafts or canisters or boxes just as one likes to call them. One of the growths had twenty-eight leaves, one or two of which had been partially amputated, but not to disfigure the plant. A group coming up in ten growths was quite a treat to look at—not grown cold, nor subjected to more air than usual for such a house, and yet the condition all but as perfect as possible to command. A great *Cœlogyne cristata* in a No. 1 pot raised up pile after pile of bulbs to form a cairn, such as one sometimes sees a collection of fruit at a local show raised on a round basket. Another very noticeable example of superb cultivation was *Cymbidium eburneum*, in fine flower, with about eight leafy growths without a speck of disfigurement. Singularly enough this plant was grown in pure loam, and the leafy growths bore testimony to its effects upon them; they were of a pale green, stiff and stout—not dark green like those grown in peat and sphagnum and charcoal: this indeed was a striking example of a terrestrial Orchid being treated in the way that it ought to be. There were quantities of *Pilumna nobilis*, *Trichopilia fragrans*, *crispa*, and the rare and beautiful *lepidia* in one or two plants. Here also was a group of so-called *Lælia anceps Dawsoni*: if they be true they will in time be beautiful subjects.

But I have already gone over much space, and must reserve much that I have to say till some other issue. *James Anderson, Meadowbank Nurseries, Glasgow.*

**PRIMULA SPECTABILIS.**—This has been termed one of the finest of the alpine Primroses, and there is much truth in the remark. The leaves are somewhat thick and fleshy, rounded, and gathered together in the form of a rosette, and the flower-heads are produced on stems; a truss will carry several blossoms of a pleasing shade of rosy-purple. It is one of the hardy Primroses that appear to succeed best under pot cultivation, and all who are successful in blooming it will be vastly pleased with the floral treasure.

GARDEN GOSSIP.

By A LADY.—No. III.

AN ALPINE GARDEN (continued from p. 299.)—A few years' experience has convinced me that the best way to grow alpine seeds sent from abroad, is to sow them directly they arrive; if kept till the following spring but few will come up. I usually sow them in shallow pans and keep them under glass, but not in heat, till the following May, by which time the seedlings are probably fit to plant out. Some seeds seem to prefer being laid on the surface, refusing to germinate if covered with soil; many are very slow in germinating: it is therefore never wise to throw away the soil they were sown in. I usually, when in despair of seeing them come up, give them a last chance by spreading the earth that contained them over some part of my alpine garden.

When roots are sent from abroad in letters, they should be wrapped in oiled silk, to prevent evaporation, and a luggage label attached for the direction:

the open air to await the protracted revival of their occupants; and this inconvenience makes me prefer to establish my plants at once in my garden if I can possibly do so.

Besides, if left through the winter in frames that are not under the care of an experienced gardener, many plants will probably be lost by "damping off," as to regulate properly the amount of air and light required in winter weather for hardy mountain plants deprived of their natural protection of snow is a task beyond the powers of most lady gardeners. Those who are fortunate enough to have a greenhouse accessible from a sitting-room will of course winter their newly arrived alpinists there, where they will be under their own care, and if the house be not heated so much the better.

My readers will have observed that the principal quality necessary to make a successful alpine gardener is patience. Without this ingredient in their composition let no one hope to succeed. I have also great doubts as to whether some slight knowledge of botany is not essential to the full enjoyment of alpinists; with-

FIG. 72.—TWO ALPINES.

this saves the plants from getting injured by the postman's stamp. On receiving such a parcel, if it be early in the season, I put the plants at once into my garden, in the places where I intend them to remain; but if it is late in the autumn, this plan does not answer, as they have not time to get established before the winter arrives; a frame is, therefore, needed for these, but not heat, nor must they be kept in the frame when the cold spring winds have passed away, for the earlier they are established out-of-doors the better will they thrive in the long run. But a large proportion of alpine plants die down in the autumn, and it is possible that in a late season (like that of last year) they may not have reappeared aboveground even in May. We must not, therefore, conclude that they are dead. I have often known a plant to reappear long after I had given it up for lost; or when in despair I have emptied the pan containing it, I have detected signs of life which have made me regret my lack of patience. For this reason alpinists should never be wintered in frames that will be required for other purposes in the spring, unless they are in pots or pans that can be removed into

out it is certainly best to trust to gardeners to supply plants, since a non-botanist collecting abroad will be sure to send over plants that could have been found at home, and the non-botanist on receiving them will not always be able to distinguish between treasures and rubbish.

To those who recognise beauty in colour alone many interesting alpinists are unattractive, let such stick to bedding-out flowers and leave our "weeds" alone, for the alpine garden will never be gay enough to please them. To many it is an enigma how any one can care to grow "Buttercups and Daisies" in their garden, and a shrug of the shoulders is the only answer when it is pointed out to them that *Geum montanum* is not a Buttercup (fig. lower plant), and that *Bellidiastrum Michellii* is not a Daisy (fig. upper plant). The entirely white blossoms of the latter plant cannot wholly rival those of our "wee, modest, crimson-tipped flower," and the underside of the petals being as white as the upper surface, pressing down the blossoms, exposes no bright colour, so that had this been the Daisy of our fields Tennyson could never have written of Maud—

"Her feet have touch'd the meadows,  
And left the Daisies rosy."

A. B.

CONCERNING FLOWER SHOWS.—IV.

(Concluded from p. 333.)

I DO NOT know of a simpler or better system for the secretary of a flower show to adopt in registering and classifying the entries than that in use by the Royal Horticultural Society, and as this is not so generally known as it deserves to be, I shall do my best to describe it plainly in detail. The characteristics of any good system are fulness, accuracy, clearness, simplicity, and usefulness. Tried by these tests I do not think this will be found wanting in any respect.

Day by day as the entries are received they should be registered in the "Index Book" which as its name suggests is arranged like the index of a ledger—one or, if required, more pages being appropriated to each letter. The particulars registered about each entry are—date when it is received, name and address of the exhibitor, class exhibited in, number of passes allowed, and amount of prizes awarded. As an exhibitor usually makes all his entries for a show at the same time, these of course follow one another consecutively in the Index Book, but as additions or alterations may have to be made, it is advisable to leave a few lines blank between each entry. An alphabetical arrangement has the advantage of being the easiest for reference. Ultimately this book will contain a record of the amount of prize-money won by each successful exhibitor. Supposing entries are received on June 21 from ten exhibitors, and that five of them have names beginning with M, they will appear on the page M in the Index Book, as in the following example, which will show how the book is ruled.

SPECIMEN PAGE OF "INDEX BOOK."

Date.	Name.	Address.	Class.	No. of Passes.	Amount of Prizes.
1880.					£. s. d.
June 21	Melville, Geo.	Dulwich	1	4	10 0 0
	Ditto	Ditto	2	2	
	Ditto	Ditto	5		3 0 0
					13 0 0
" 21	Mander, Edwd.	York	4		1 10 0
" 21	Merton, Hy.	Yeovil	2	2	4 0 0
	Ditto	Ditto	3	1	
	Ditto	Ditto	8		1 0 0
" 22	Ditto	Ditto	4	1	
					5 0 0
" 21	Manton, F.	Hertford	3	1	4 0 0
" 21	Ditto	Ditto	7	1	2 0 0
" 21	Ditto	Ditto	10		
" 21	Ditto	Ditto	12		
					6 0 0
" 21	Merivale, Wm.	Bedford	6	1	
" 23	Ditto	Ditto	1	4	

This specimen is filled up as it would be after the prizes are awarded, and it will be seen it contains a summary of information about every exhibitor. It shows that Geo. Melville made entries in three classes on June 21, that six passes were sent to him, and that he won £13 in prizes. It shows that Hy. Merton, on June 21, entered in three classes, and had three passes sent him; that he made another entry on the 22nd and had another pass, and that he won £5 in prizes. It shows that Wm. Merivale made one entry on June 21 and another on June 23, that he had five passes in all sent him, and that he did not win a prize.

The next step is to copy the entries into the "Class Book," which will have a page set apart for each class in the schedule, and I append a specimen of it in which one of the entries given above in the register is repeated along with others supposed to be made on other days besides that the records of which are given on the specimen page above. The following shows the number of the class in the schedule, the description of the class, the amount of prizes offered, the number of each entry, name and address of exhibitor, and the awards.

SPECIMEN PAGE FROM "CLASS BOOK."  
 CLASS I.  
 COLLECTION OF TWELVE STOVE OR GREENHOUSE PLANTS.  
*Nurserymen. £10, £9, £8.*

Entry No.	Name and Address of Exhibitors.	Prizes Awarded.
1	Burton, J., Barmouth .. ..	£ 5 d.
2	Melville, G., Dulwich .. ..	1st 10 0 0
3	Carter, L., Leighton .. ..	
4	Nokes, S., Hertford .. ..	2d 9 0 0
5	Oliver, T., Burton-on-Trent ..	3d 8 0 0

Each class will be treated in the same way, and the exhibits will be numbered consecutively, commencing with 1, in the order they are received.

The exhibitors' cards for each entry are then written from this book, and the simplest form is the following:—

EXHIBITOR'S CARD.

**ROYAL HORTICULTURAL SOCIETY.**

—♦—

CLASS I.

COLLECTION OF STOVE OR GREENHOUSE PLANTS.

NURSEYMEN.

*Exhibited by*

MR. J. BURTON,  
BARMOUTH.

On the back of this card will be placed the number of the class and the number of the entry in it:—

BACK OF EXHIBITOR'S CARD.

CLASS I.

No. 1.

Until the judges have made their awards these cards are placed face downwards, and Mr. Burton's exhibit will be known as No. 1 in class I. When the awards are made the exhibitors' cards are placed with the side containing names, &c., uppermost.

The judges' books are next produced. The most useful form I know of is that called *The "Field" Duplicate Judging Book*, which can be purchased at 346, Strand, W.C., for 6d. each, or 2s. 6d. per half-dozen. Below I give a specimen page, filled up in duplicate after the awards are made. This book, when handed to the judges, is an exact copy of the Class Book, minus the names of the exhibitors, and enables the judges to identify the exhibits, the numbers given agreeing with those on the back of the exhibitor's cards. Thus, when it is seen that exhibit No. 2 is entitled to the 1st prize, the word "First" will be written in line 2 and in the corresponding line in the duplicate. When the awards are all finished the duplicate will be detached and forwarded to the secretary for use in preparing the prize-cards. Each page of the judge's book is perforated down the centre.

JUDGE'S BOOK.

4.	Second.	4.	Second.
5.	Third.	5.	Third.

This method, it will at once be seen, complies with the requirements set forth in my first paragraph. It gives the fullest details, it is accurate, clear, simple, and useful. If there are any advantages in the old-fashioned "close" system I think they will, on trial, all be found here; and what will certainly not be found here are the cumbersomeness and difficulties of that system. *G. E. R.*

ARTIFICIAL SOURCES OF HEAT AND LIGHT FOR PLANTS.

IN experiments with electric and other artificial lights upon the growth of plants, it would be very desirable to ascertain what are the exact effects, in the first place, of the total amount of heat and light respectively emitted by the artificial luminaries, and, secondly, the relative effects of the different rays of their spectra. MM. Dehérain and Maquenne\* have lately conducted experiments with the Drummond light and the Bourbouze lamp by allowing the rays to fall directly upon leaves, but first passing through water, benzine, and chloroform, respectively. Their results appear to show conclusively that in proportion as the obscure heat rays are cut off by those media, the deoxidising process is relatively enhanced, and *vice versa*. They thus sum up their conclusions:—

"1. Leaves placed in tubes immersed in water and kept at a short distance from the luminous source decompose carbonic acid when they are exposed to the action of the Drummond light. 2. They decompose it still, but more feebly, when they are illuminated by the Bourbouze lamp. 3. When the leaves are protected by a layer of water decomposition always takes place: when they are enveloped in benzine, which is much more diathermic than water, decomposition is still sensible under the influence of the Drummond light, it is no longer so under that of the Bourbouze lamp; and one observes in general the inverse phenomena of absorption of oxygen and the emission of carbonic acid."

Assuming their results to be correct, they prove that for deoxidisation by green organs with artificial sources of light the reduction of the obscure heat is the chief point to be considered, inasmuch as respiration is increased by and is proportionate to increments of heat; and if this process is in too great activity, the chlorophyll granules cannot do their work of deoxidisation, the normal function of the green colour being to regulate respiration under sunlight, so that the assimilative power of the granules can now be in the ascendancy and deoxidisation of carbon dioxide effected.

When, however, the production of fruit is the point in question, then it seems desirable to consider the presence of heat as much as, if not more than, that of light. We have lately seen how aromas, colours of flowers, leaves, and corn seeds are benefited by growing in northern latitudes where the light is more uninterrupted while the mean temperature is lower than in lower latitudes; but, on the other hand, sugar is proportionately diminished, as the formation of sugar requires not only additional water but apparently a relatively higher temperature.

With reference to this point, however, M. Gaston Bonnier's researches‡ on the physiology of nectaries do not appear to corroborate those of Dr. Schubeler, for he finds that the volume of sugary fluid collected at the same hours upon flowers of the same age and of the same species has always been greater in Scandinavia than in France; and he adds that certain species, such as *Potentilla Tormentilla*, the nectaries of which do not produce over-much liquid in France, secrete it abundantly in Norway; and he concludes that "the external production of nectar appears to increase with the latitude."

However, as M. Bonnier shows that the production of nectar is influenced by various conditions, such as the amount of water absorbed by the roots, the hygrometric state of the air, &c., Dr. Schubeler's observations may have been made under conditions little favourable for the development of sugar. In whatever way these results may be harmonised, plenty of water is necessary for abundance of sugar, and probably a relatively higher temperature is required than for "greening" and deoxidisation.

Now, from Dr. Siemens' statement, it would seem that the electric light *alone* is not equal to sunlight,

for he says:—"Those [pots] exposed to electric light only showed a light green leaf, and [but?] had sufficient vigour to survive. Those exposed to daylight only were of a darker green and greater vigour." I am told, however, by persons who saw the plants, that they did not perceive any appreciable difference between the pots. One would, therefore, be glad to know if Dr. Siemens himself, or Mr. Buchanan, could see generally any deficiency in the electric light *alone* as compared with sunlight *alone*, in producing the green colour. Here, then, is another point for investigation. For Wiesner has shown (contrary to the usual belief) that the blue rays are the most powerful to render etiolated plants green, though perhaps all rays may do it to some extent, for he says\* that *Trifolium pratense* etiolated turned green after two hours' exposure to light transmitted through sulphate of copper, but was not visibly green after four hours' exposure to light passing through bichromate of potash; white parts exposed to diffused light had turned green. Now, as the electric light would seem to be particularly strong in the blue rays, one would infer from this that it would be proportionately powerful to produce a dark green colour. Yet, as Dr. Siemens says it produced a pale green, the conclusion seems inevitable (from Dehérain and Maquenne's results) that its obscure heat rays are too powerful, and so neutralise the full effect of the light rays.

In a subsequent report Dr. Siemens says:—"The Strawberries exposed to [sunlight as well as] the electric light have made extraordinary progress." One would be glad to have a report upon the *flavour* produced under electric light *alone*. Comparing the description of the "greening" with this latter observation, if the first does not read as being particularly satisfactory as far as the development of the plants is concerned, the latter statement appears to imply that the heat *per se* of the electric light was amply sufficient, and was, therefore, more potent in *both* cases than its light.

Hence, if this surmise be true, wherever it may be desirable or necessary to supply the electric light for vegetative growth, it would perhaps be desirable to cut off its obscure heat by passing it through a layer of water or alum in solution; but, on the other hand, for ripening saccharine fruits, it would be desirable to give them the full benefit of its heat as well.

When the plant has sunlight by day and electric light by night (which will probably be the condition of things if it ever becomes useful in horticulture), the conclusion seems inevitable that the weakness of this light to produce chlorophyll will be compensated for by the light of the sun, so that an uninterrupted and vigorous growth is maintained; but when the fruiting time comes on, then the electric light will furnish an uninterrupted supply of heat necessary to develop the sugar, which the sun may in this climate often fail to do. *George Henslow.*

BIARRITZ.

THERE is no dearth of flowers to be complained of now: the lovely *Daphne Cneorum*, with its sweet pink blossoms, is out in profusion; and the exquisitely coloured *Lithospermum prostratum*, more intensely blue than any *Gentian*. Both grow on rough ground, and those who pluck must be prepared to encounter "toothed Briers, sharp Furzes, pricking Gorse and Thorns."

We spent one day at Monguerre, and came back laden with pseudo-Narcissus. They were only just coming into bloom, but the whole wood seemed made of them until close inspection showed that many promising clumps of leaves belonged to a variety of *Asphodelus albus*, black and ugly-looking when in bud, but handsome when it comes into full flower. On the other side of Biarritz grows *Narcissus Bulbocodium*, the Hoop-petticoat of vulgar tongues, and surely the prettiest and most graceful of all its family; the *Saffran printanier*, or *Crocus vernus*, and *Scilla umbellata*. These plants show not in units but hundreds on the spots they favour, for Nature is lavish in her breadths of colour—not dotting here and there after the manner of the usual herbaceous border, but making bold masses for the eye to rest on. How few carry out her teaching? Not one gardener in fifty, given bulbs of *Anemone*, or *Narcissus*, or *Scilla*, would plant after her fashion—the *Anemones* together, to bend in unison their slender stalks before each passing breeze, and raise at once their

*Ann. des Sci. Nat.*, sixième série, tome ix., p. 47.  
 † *Gardeners' Chronicle*, vol. xiii., p. 272.  
 ‡ *Bull. de la Soc. Bot. de Fr.*, 1878, p. 2.

starry heads when its breath has passed over them; "the Daffodils, that come before the swallow dare," showing clear yellow in the faint spring sun; the Scillas making soft lines above the ground. Rather they would be placed cheek by jowl in dabs of antagonistic tints, or a few here, a few there—irritating spots, to stab the eye used to Nature's painting, as the sound of a false note wounds the educated ear.

The Dog-tooth Violet grows near the cemeteries built in 1876, in memory of the officers who fell in the sortie from Bayonne in 1814. The resting-place of the 31 Dragoon Guards is well situated, looking down on a lake and Pine woods. There seems a shimmer of water everywhere, for the silvery glint of the sea and of the river show through the tree-stems. The Coldstreams lie in a parallel line lower down, and both God's Acres are bordered with broad bands of white Periwinkle, planted, I wonder, from the fancy of the name having to do with Vinco—to conquer the goal of the calling of the dead? Although the Italian name for this flower is "fior da Morto," I never remember seeing it in a burial ground before.

The most magnificent view in this country is from Mr. Hart's house, who has taken the leading part in the making of these cemeteries, acting for Miss Holburne, at whose cost the patriotic work has been executed. You see the river from it, and the best part of the town of Bayonne, including the two spires of the Cathedral, and beyond the fine lines of the Basses Pyrenees. Banksian, and a delicious tea-scented white Rose covered the garden wall the day we were there, and the front of the house was smothered with Wistaria.

We learnt that the winter of 1878, so bitter in Great Britain, though excessively wet, was mild in these parts, and as a proof a Brugmansia, whose usual habit is to die down, omitted to perform that ceremony, and so husbanded its strength as to be able to flower three successive times last summer! This winter the plant followed its normal routine.

The memory of our day spent at Cambo drew us thither again, and if the place pleased us before vegetation had started, how much more must we have admired when the hedges were green, and the fruit trees all a-blow. Pears and Cherries weighed down with snowy blossom, the tender green of the Bramble straggling over Privet and Blackthorn in full flower.

Cambo is rich in scarlet Anemones, the double tassel-like Pavonina and the single fulgens, from which I fancy the former is only a sport; but they are very local, inhabiting only in quantity two fields. You pay a toll of 50 centimes, and then may pick at pleasure. The ground they grow in is ploughed over every year. Hepatica triloba is common about Cambo, and an Orchid showing like a purple Crocus above the ground: it was only by digging down with my knife that I discovered its nature. *Ixia Bulbocodium* is to be found, I am told, but I have not seen it, nor *Serapias Lingua*. *Potentilla*, yellow and white, make a great show; and *Saxifraga Geum*, with its beautiful red colouring of the under part of leaf. This we found in the wood at Cambo, growing in the drip of water on some rocks, which would have made the glory of a home fernery.

The river Nive ought to be a model fishing river, but it is very much poached; and we ourselves saw more than one grab-all at work. Big salmon are caught in the weirs, and alas! little ones too, which are never thrown back to have a chance of growing; but they are not so bloodthirsty in the matter of slaying small birds as in most parts of France. I saw never a *chasseur*, and heard many a songster. *A.*

## PINE CULTIVATION IN JAMAICA.

SUCCESSFUL Pine-apple cultivation in Jamaica, although at present on a small scale, is now an accomplished fact. On taking a general view of the suitability of the different elevations for Pine culture, the plains on the south side of the island are found to possess many advantages, which cannot be obtained in other situations of greater height. The soil required for their growth is best described as a sandy loam, containing quantities of decaying fibrous material. This is to be found on many of the estates situated in the Liguanea plains near Kingston, on parts of them called "ruinate," or lands long since abandoned, and now covered with bush, scrub, and native grasses. It is not intended to convey the idea that Pines will only do well in the class of soil indicated, for the Pine-apple is very accommodating in this respect, and will grow in soils of nearly opposite

character, and produce good fruit; but for the general purposes of extensive cultivation the kind mentioned is, I think, the best, and Pines can be grown in it equal in size and flavour to any in the world.

The principal varieties cultivated are the Black Jamaica and the Ripley, which latter is of as fine a flavour as any in cultivation. It is said to have been introduced into Jamaica from Antigua, and there are two varieties of it (one of which I have lately found can be produced from the other, and *vice versa*). The first is of very much darker colour and resembles the Black Antigua, while the other or lighter coloured variety is well known to English growers as the Ripley Queen; Charlotte Rothschild, Queen, Monseratt, and two varieties called locally "Sugar Loaf" and "Cow Boy," are also grown. Fruit of Charlotte Rothschild has recently been produced weighing 10 lb., without any special cultivation. The varieties to be cultivated have to be determined by the market for which they are intended, but for general purposes the Ripley and Black Jamaica answer best. The quality of Jamaica Pine-apples is now, however, becoming known in many foreign markets, and there is a gradual though small increase in the demand for them.

In planting the following method has been found very successful. The ground intended for planting is cleared of all surface accumulations, consisting of grasses, weeds, &c., which is arranged in rows 4 feet from centre to centre; these, when covered with earth from the interspaces sufficient to form a ridge 1 foot above the surface, are allowed to settle for a time to consolidate and allow the rankest of the weeds to decay in some measure. Suckers are then selected, which should be of good size, viz., about as large as a half-grown fruiting plant in English hothouses, and having had a few of their lower leaves removed, to give the rootlets in their axils ready access to the soils, they are placed in holes on the top of the ridges, 2 feet apart, and rammed firmly down with a wooden rammer, leaving a small basin-like cavity at the base of each stem to hold water sufficient to render the ground solid, and fix them firmly in their places. Water once or twice at the most is only necessary, except in cases of exceptional drought. Planting may be done at any time, but the most favourable periods are January and October, provided the weather is not too wet.

The fruiting season commences in April and May and ends in November; where, however, large breadths of Pines are planted they are never out of season the year round. It is found that after a season of wet weather those fruit nearest maturity are liable to become black or acid in their centre, even before the process of coloration begins. This will perhaps throw some light on the cause of the same fact occurring with British growers. It is also found that the more a fruit is shaded, or surrounded closely by its own leaves, the better the Pine colours; should the Pine happen to fall out of its vertical position it is often scorched, by the direct rays of the sun falling on it when covered with moisture.

It is to be regretted that more attention is not paid to the cultivation of this article of luxury in the island, for if well conducted nothing pays better. I know of no piece of ground larger than 2 acres in one lot exclusively devoted to their culture, and yet off one acre this year, within 6 miles of Kingston, the return has been £80 sterling clear of expenses—the owner having sold many in the home, but his principal sales going to the New York markets. Pine-apples can be grown here and sold at a good profit for 4*d.* each, weighing from 2 lb. to 4 lb. It is puzzling to find, that with such great facilities, given by the good steam communication now obtainable, for disposal of the produce, more has not been done in way of exporting this fruit, both in the fresh and also in the preserved state. No company at present exists in the island for preserving the fruit, the small attempts which have been made from time to time by private individuals meeting with but little success, from the desultory way in which the business has been conducted. This, now one of the minor products of Jamaica, would, if sufficient capital, energy, and perseverance were brought to bear upon it, become one of the staple articles of export. *J. H., King's House, Kingston, Jamaica.*

ERIA EXTINGUENTIA. — The Orchidists are not likely to go mad over this plant nor the Floral Committee to give it an award; nevertheless it is both pretty and interesting. The flat-cheese like pseudobulbs, the stiff wiry flower-stalks, and the single pale lilac flowers, are all points which a plant lover would appreciate. It is in bloom now in Mr. B. S. Williams' Nursery.

## CINCHONAS.

IN a previous communication (last May) I dwell upon the success of the cultivation of Cinchona in Java, reserving what I had to say respecting the British plantations. I am now able to speak with certainty as to the yield of these latter for the year 1879, having before me a table compiled with great care by Messrs. Woodhouse, Mincing Lane, for private circulation, giving all particulars of the importations from every estate in India and in Jamaica. The total number of packages from the Government plantations at Ootacamund amounts to the following:—From Dodabetta, 429; from Nedivuttum, 779; from Pykara, 241. From Jamaica 16 bags are next recorded. From private plantations on the Neilgherries, 577; from Darjeeling, 1050; and from Ceylon, 6229.

The compilers say:—"In handing you the accompanying tables, we think it well to call the attention of planters to the following features:—In the first place, the extreme rates realised by the renewed bark, both crown and succirubra; the prices, as compared with the natural bark, being in most cases nearly double, and in red bark frequently more. This is to a great extent accounted for by the analysis. . . . The highest price paid during the year was 12*s.* 8*d.* per pound for eleven cases renewed crown, marked W.R.A. } The largest private estate appears to be in Darjeeling, which sent out 944 packages. . . . Prospect. }

These realised full prices, the long selected quills being especially suitable for druggists. The chief feature in Ceylon descriptions is the very large proportion of twigs and shavings, amounting to 30*s.* 9 packages out of a total of 6229."

The prices obtained for the bark from Ootacamund ruled much higher than those obtained for the Darjeeling lots, none of which fetched more than 2*s.* 10*d.*, but some of the Ceylon bark brought from 7*s.* to 8*s.* We may safely conclude that the introduction of the red bark (*C. succirubra*) has been quite a success, especially when the bark can be renewed according to the process of the late Mr. McIvor. The tree retains its peculiar properties as to chemical constitution under all circumstances.

The true *C. officinalis* var. *Uritusinga* has also prospered well at the Dodabetta plantation. A large portion of these trees, represented in my *Quinology of the East India Plantations*, are also producing excellent bark. They had attained an average height of 28 feet, with a girth of 22 inches, in 1878, or fifteen years' growth (*Ceylon Observer*, January 16, 1879), having been planted in 1863; and, according to the Government report, yielded 38,801 lb. of bark in the year 1877-78. The prices obtained were—for the natural bark 7*s.* 10*d.*, mossed bark 9*s.* 3*d.*, and renewed crown 10*s.* 11*d.*

A considerable number of these trees were the descendants of a plant, about 5 feet in height, which I presented to the Indian Government, having received the seed from the mountains of Uritusinga, near Loja, in South America. This small tree arrived April 18, 1862, at Ootacamund, in a languishing condition, but, thanks to the skill and care of Mr. McIvor, it began to recover; so that by May 31 it was possible to obtain some cuttings, and by Dec. 31, 1863, this one plant had produced 6850 new ones. At a subsequent period Mr. McIvor told me these had multiplied to more than 60,000, so that a considerable portion of the Dodabetta plantation must consist of its descendants. The bark of these trees given me by Mr. McIvor yielded 7.40 per cent. of fine sulphate of quinine. I have, therefore, recommended those who wish to plant crown bark, to obtain seed from this Dodabetta plantation. The habit of the plant may be seen from the accompanying woodcut (fig. 73) of one of the plants which I obtained from its native habitat, and have described in the *Nueva Quinologia*. According to its discoverer, Pavon, it grows to the height of 60 feet and more.

The narrow-leaved form which re-appeared in India, and produced nearly 10 per cent. of quinine, appears to have been considered by Pavon to be identical with this; so in my Pavon MS. it is written "olim angustifolia." The Uritusinga is described finally as "foliis lanceolatis," and "angustis" is (rightly) erased. I have seen the leaves vary on the same plant. The other variety (fig. 74), photographed from a plant in my conservatories, of the var. *Amarilla del Rey*, now called *Bonplandiana*, does not rise beyond the dignity of a tall shrub. I cut down the leading

stem, and this yielded on analysis quinine and cinchonidine in nearly equal proportions; also cinchonine; it is therefore a variety less adapted for cultivation, at least when the soil is rich, though it may be suited (as in Ceylon) for some exposed situations with shallow depth of earth. I have figured it in plate xi. of my *Quinology of the East Indian Plantations*.

It is very difficult to say what are the predominant species in cultivation in addition to those above-named, especially as we have no satisfactory report of the amount of hybridisation that may have occurred. All the Calisayas introduced by Mr. Markham perished, owing to the salt water having penetrated to the roots of the plants in passing down the Red Sea, and a like fate, though not from the same cause, befel most of the Ledgerianas raised from seed at Ootacamund. The climate may be too severe, as the neighbourhood is described (in the *Ceylon Observer*) as, in the language of one of our northern countrymen, the very "trysting place of the winds." The Pitayo barks have been introduced, and it is very desirable that their cultivation should be extended. I do not think that the true *C. officinalis* ever existed at Darjeeling or in Ceylon. The attempt to grow crown bark at the former place has been (as I understand) a failure; from the latter I have specimens of the *angustifolia* form, but not of the normal *C. Uritusinga*. *C. Calisaya*, from Darjeeling (as far as specimens have fallen under my notice), is very poor in quinine.

It is to be regretted that since Mr. McIvor's death, and the (not so very mysterious) disappearance of Mr. Broughton, there has been so little scientific guidance afforded to the cultivators. We are indebted still to Java for this.

Whilst I am writing there comes to hand the following comparative analyses, obligingly sent me by the Dutch authorities, from the same tree of *C. Ledgeriana* :—

<i>Bark Dried in Sunshine.</i>				
Quinine	..	..	..	11.66
Cinchonine	..	..	..	0.34
Amorph. alk.	..	..	..	0.45
Total	..	..	..	12.45
<i>Bark Dried by Artificial Heat.</i>				
Quinine	..	..	..	11.68
Cinchonine	..	..	..	0.34
Amorph. alk.	..	..	..	0.51
Total	..	..	..	12.53

I have under my eye a botanical specimen, sent by a planter in Ceylon, with bark for analysis. He says that it is pronounced by Dr. Thwaites "pure Calisaya," with which definition I quite agree, but the flowers are said to be white, which shows variety (in so far) from the *vera* of Weddell. They are quite unlike those of the variety *Ledgeriana*. The bark gives a produce equal to 3.4 per cent. of sulphate of quinine. I think that this may be the same as the Darjeeling sort, existing under more favourable circumstances in Ceylon.

It appears from Dr. King's issued report on the Government plantations in Sikkim (*Ceylon Observer*, February 4, 1880), that the number of trees there planted out amount to more than 4,000,000. In Ceylon and other parts of India the cultivation is also being carried on with great vigour. Some of the planters are becoming alive to the necessity of care in selecting the best species, and the measure of success already attained with the *Ledgeriana* in at least one quarter, encourages the best hopes.

We find in the report of the Commissioner of the Neilgherries (no successor to Mr. McIvor having been yet appointed) much interesting information (*Ceylon Observer*, December 18, 1879). Under the head "nurseries" Mr. Barlow states that "604,855 plants were distributed to the public during the year, against 187,350 in the previous year. [The question arises, Of what kind, or form, or species were these?] The quantity of seed distributed was 1322 lb. against 326 lb. in 1877-78. Most of this seed was sent to Ceylon where I believe it is sown broadcast amongst old Coffee."

The Editor of the paper from which I quote remarks further :—"We have seen it stated that 80,000 seedlings is a fair average number to be expected from 1 lb. of *Cinchona* seed; although a planter at Kandapolla tells us he has got 250,000 from 1 lb. of *C. officinalis* seed from an estate in Dimbula. Practically, he reports every seed grows. . . . To return to the enormous quantity, 1048 lb., distributed, from the Neilgherry plantations, in

India and Ceylon in two years! At the moderate average of 80,000 seedlings to 1 lb., the result would be no fewer than 131,840,000 plants from this source apart from seedlings from private plantations in India and Ceylon. This would probably raise the total to 200,000,000 of seedlings—about enough, one would think, to stock the whole of the hill countries of India and Ceylon."

Your readers will bear in mind that this is all theory, except, indeed, the fact that every seed placed in favourable circumstances may be expected to germinate. Fortunately for the planters themselves, no such calculation as the above holds good in reality.

## Florists' Flowers.

THE NATIONAL AURICULA SOCIETY'S SHOW (SOUTHERN SECTION).—With reference to a proposition which has been made, that in place of the mid-day meeting, the members, friends and exhibitors of the National Auricula Society (Southern Section) should dine together on the evening of the 20th at the Horticultural Club, Arundel Street, Strand; as I am quite without the time or strength to engage in a long correspondence on the subject, will you kindly permit me to say there are insuperable obstacles in the way? In the first place a mid-day season of refresh-

FIG. 73.—CINCHONA OFFICINALIS, & URITUSINGA.

The world is in no danger for some time to come of being inundated with barks from India. The whole supply from all quarters probably would not suffice to keep the quinine manufactories at present existing in full operation.

But another factor in the calculation has to be taken into account—that in more than one quarter (as I have reason to believe) highly successful efforts are being made to cultivate the best sorts in their native climes in South America.

I will not add to the length of this paper by furnishing deductions which your readers can supply for themselves. I have sought to present facts, as far as space would permit, for the formation of a judgment on the whole subject. *John Elias Howard, F.R.S.*

ment is a necessity: after the arduous labours of their several parts, the mortal coil of judges, exhibitors, and executives alike require some sustenance; and if that season be not utilised for a little social and floral communion, excepting for a very small proportion of those interested, the opportunity will be irretrievably lost. At the close of the show six-sevenths of the exhibitors are engrossed with the care of their exhibits, and all concerned in the show are certain to be jaded more or less with the labours of the day, and unfitted and indisposed to prolong its hours even for the gratification of the table or the greater pleasures of social and floral communion. To any friend or friends who may arrive in London on the evening of the 19th, as many will, I offer a hearty invitation to my house for such a season

FIG. 74.—CINCHONA OFFICINALIS, VAR. BONPLANDIANA, (SEE P. 427.)

of floral intercourse as time may allow, and it will be a sincere pleasure to me if a large circle is formed.

I am very happy to report, as my correspondence informs me, that we have the prospect of the largest and finest display of Auriculas yet attained. From several sides adjectives of very expressive character are used to indicate the state of the plants, and large expectation is based upon the anticipated appearance of new faces of a very high order of merit. In Polyanthus also emulation has been freely excited, and though it is not yet an open secret, there are confident predictions of many very beautiful new flowers being brought forward in this sometime neglected class. *F. S. Doakell, 11, Chatham Terrace, Larkhall Rise, Clapham, S.W.*

SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS (continued from p. 408).—PANSIES.

Those in the open ground are now making good growths; many of the varieties are in flower. Slugs are troublesome, and they sadly injure the flowers by eating them in bud. Pick them off at night, and destroy them; look out for the leather-coated grub at the same time. Keep the surface of the beds stirred as often as this is required, and also destroy weeds. Plants in pots are now rewarding the cultivator with plenty of most beautiful richly tinted flowers. The frames containing the plants should be kept well aired, as the Pansy is most impatient of insufficient ventilation. Pull the lights quite off in fine weather.

PINKS.

The forcing section, comprising such varieties as Lady Blanche, Mrs. Pettifer, Newmarket, Lord Lyons, Derby Day, and a few others, if they were placed early in a forcing-house will soon be in flower; ours are considerably advanced towards that stage—they had produced plenty of small side growths, and these were taken off, a dozen or fifteen of them inserted in 5-inch pots, and the pots were then plunged in a hotbed; a square of glass placed over the cuttings, and resting on the labels, is very desirable, as it retains the moisture sufficiently about them to prevent their shrivelling. The surface of the beds out-of-doors should have been dressed, but if this has not been done see to it at once.

PHLOXES IN POTS.

If two-year-old plants are being grown, and these have up to this time been in cold frames, they may now be plunged out-of-doors in an open position. Cuttings that were put into small pots a few weeks ago are now rooted; indeed, they have made considerable growth, and are now ready to be potted off. To save trouble, I pot them at once into their flowering pots, using rich soil and well-drained pots 6 inches in diameter.

POLYANTHUSES.

Although the season is early, these plants will not be in flower this year earlier than the Auriculas. I fancy that the flowers are not so large, nor are the plants so strong as last year, but the quality is certainly better. George IV., Lancer, Black and Gold, Pearson's Alexander, and a few others, are now showing flower, so that the probable quality of the whole collection can be very fairly judged from them. They require plenty of water at the roots now, and plenty of air, else the flower-stems will be weak.

PLANTS IN COLD FRAMES.

Aquilegias are the most beautiful plants of this class that we grow in pots. They have usually been kept in the cold frames until the end of April or early in May, but we wanted the space for Auriculas, Carnations, &c., so that these and many other plants have been placed out-of-doors. The very beautiful pure white Anthericum Liliastrium and Trillium grandiflorum are very desirable plants to grow in pots; of each of the above there is a major variety which much surpasses the normal forms in size, and equals them in purity. Meconopsis nepalensis and many other scarce and beautiful plants that we grow in pots, have all been plunged out-of-doors to be placed in the greenhouse as soon as the first flowers open. All such flowers are greatly admired by visitors, and all the more so because very few of our visitors have seen them previously. Ixias and Tritonias have still been kept under glass, placing them very close to it, and ventilating freely. The secret of growing these very pretty flowers is to admit plenty of air and light to them; they require but little attention, and cannot bear coddling in a greenhouse far from the glass and shaded from the sun with blinds. This accounts for the failure of some people to grow them well,

## GREENHOUSE FLORISTS' FLOWERS.

**AZALEAS.**—There is no difficulty in forcing these at this season of the year. What the plants require is a moderately moist atmosphere and to be syringed daily, or perhaps twice a day if the drying east winds continue. Inexperienced persons are apt to starve the plants for want of water at the roots, until the compost becomes so thoroughly compacted that water does not readily pass through it after it becomes dry. Water thoroughly every time the plants require it.

**BEGONIAS.**

These showy plants are sure to become popular with those who have not sufficient knowledge to grow choice hard-wooded greenhouse plants. They grow rapidly, and soon fill up a large space. Early started plants are now growing freely, and must be potted on as they require it. Those that are started in a greenhouse temperature must be shaken out and potted as they start into growth. Give each plant sufficient space to develop itself, and place them near the glass, to promote a dwarf growth.

**CALCEOLARIAS.**

The instructions given at p. 302 apply now. The aim of the cultivator is to promote a healthy growth, and this can only be done by keeping the leaves quite clean, the roots well supplied with water, and the ventilation such that drying winds cannot blow directly upon the leaves.

**CHINESE PRIMULAS.**

Perhaps few flowers are more useful than those for the decoration of the greenhouse up to this time, considering the small amount of attention they require. It will now be time to attend to seed sowing. Choose a variety having flowers of good form, substance, and colour with the pin-like stigma protruding from the eye, cross it with pollen from a rich coloured variety that has the eye filled up with the anthers. The plants at this time should be near the glass in a light airy place.

**CINERARIAS.**

Most of the specimens will now be at their best, and it is very desirable to continue them in this state as long as possible. Keep the house rather cool, but keep out the frost, which would be injurious; artificial heat will not be necessary now, but the ventilators must be closed early if there are signs of frost. Select the plants from which it is intended to save seed; place them on a shelf apart from the others. Give weak manure-water to plants coming into flower, but do not use this when the plants are in full bloom.

**CYCLAMENS.**

The general collection still continues in full beauty, and very delightful they are. If it is not intended to save seed pick off the flowers as they show signs of decay, pulling the stem quite out. The large-flowered varieties are now common and much prized; but Mr. Little informs me that, though they are useful as cut flowers, the plants do not make such good specimens as older varieties with smaller flowers. Something good might be obtained by crossing some of these large-flowered varieties that lack richness in the colour with the rich purple and crimson varieties exhibited by Mr. Little. Now is the time to attend to this.

**FUCHSIAS.**

Plants that have been started in a little heat and potted on will now be growing freely; allow them to have plenty of light; see that the plants do not suffer for want of water at the roots, and dew them overhead with a syringe. Young plants propagated from cuttings must now be potted off, each cutting into a small pot. No plant suffers more than the Fuchsia from any check to its growth, and this must be borne in mind from the beginning. They do well with a little forcing, but too much heat is injurious.

**HYACINTHS.**

The remark was made at p. 302 that well-ripened bulbs the preceding year were essential to the production of good spikes. This year's bloom has shown us that this is so; although some good spikes have been exhibited, they are the exception, not the rule. Late-blooming plants that have been kept in cold frames should at once be brought into the house to succeed those that are now going off. The plants that have ceased flowering should have the old flower-stems cut off as soon as the flowers decay, but the leaves should be kept green and healthy until they decay

naturally. The bulbs may be fairly well ripened even if the plants are merely placed in a favourable position out-of-doors when they have done flowering. I pot these bulbs three or five in 6-inch pots, and they can be forced early next year, or they may be planted out in the flower borders.

**PELARGONIUMS, LARGE-FLOWERED.**

The plants are now growing very freely indeed. The earliest to flower are showing their flower-buds; it is needless to say that strict attention is necessary to see that the plants are well watered, and if the pots are well filled with roots a little weak manure should be occasionally used. Tie out the growths as they require it, and place sticks where they are required. The plants do not like to be placed in the full blaze of the sun, and if the house has a south aspect it will be necessary to shade from the direct rays of the sun for a few hours about mid-day. See that the foliage is kept clean and healthy; if the older leaves become yellow the reason must be either lack of water at the roots or exposure to the direct rays of the sun.

**ZONAL PELARGONIUMS.**

This section is much more easily managed than the other; the leaves are not attacked by red-spider or greenfly, and their cultural requirements are very simple indeed. Often they are grown too strongly, at least the young plants; old specimens require a much richer compost to grow in. Place the plants quite near the glass, and continue to train out the shoots as they progress in growth. Young plants that are intended to flower early may be pushed forward with artificial heat, but the night temperature ought not to exceed 55°, and the ventilators should be opened a little at night but more fully by day. *J. Douglas, Loxford.*

**Foreign Correspondence.**

**BROUGHTONIA SANGUINEA AT HOME.**—Having seen this lovely Orchid growing and flowering in profusion the other day in a wild state, I thought that a note on the conditions under which I thus found it might prove acceptable to a few of your readers. It is not found anywhere in the neighbourhood of Castleton, and I had to leave our rather mountainous district and ride a distance of 10 miles northward, to within 1½ mile of the sea, near to Annato Bay, before I got to its habitat. And a most interesting ride it was along the right bank of the Wag-water River, at first a wild and formidable mountain stream, but which, as it nears the sea, wending its way through the broad alluvial valley, assumes somewhat of the aspect of a quiet English river. Here the valley, which is in great measure devoted to the cultivation of Sugar-cane, is skirted on either side by low rounded hills, which, together with Palms and others, bear a fair sprinkling of Mahogany trees. But I fancy that Mahogany must at one time have formed dense forests on these hills, for I saw, near to an old dilapidated and deserted dwelling-house, a small clump of about forty good-sized trees, which seem to have been left for the shelter of cattle. The trees in no case exceeded 40 feet in height, and seldom over 2½ feet in diameter of trunk, with the general port of old English Ash trees in winter, for not one of them had a single leaf on it, and must have been denuded for nearly a month. They were thickly studded with their curious, rusty, hard-shelled, Pear-like fruit, now ripe.

I hope to be excused for so much talk about the Mahogany trees, because it was on the rather smooth bark of the larger branches of these that our Orchid was growing. Its close thatch of almost regularly imbricated, flattened, oval-shaped tubers, in many instances completely embraced the branches for a considerable length. The plants were in full flower, and be it remembered that, there being no leaves on the trees, they were fully exposed to the glare of a tropical sun. In a week or two they will have the advantage of the partial shade afforded by the young and growing leaves of the Mahogany, but with the exception of the nightly heavy dews they will receive only occasional showers up to the month of May, after which for a month or two they will most likely be deluged with rain. But our plant, unlike the majority of shade and moisture-loving Orchids, is, from the nature of its dense thatch of tubers, well

prepared to retain all available moisture against a season of drought. While there at mid-day I did not think it very hot, and the nightly temperature is about 65° Fahr.

This Orchid does not seem to vary much, for the only deviation that I could find from the normally all-crimson flower was an exceptionally orange-tinted column. *George Syme, Castleton Botanic Gardens, Kingston, Jamaica, March 8.*

**Garden Operations.****HARDY FRUIT GARDEN.**

There is perhaps no more anxious time in the whole year than the brief period when fruit trees are swelling in the bud or in full blossom. Hope, it is said, springs eternal in the human breast; but he must be a sanguine person indeed who will expect a rich harvest of hardy fruits this season. The conclusion arrived at by all persons of practical knowledge as to the condition of fruit trees after last summer, or what was called by that name, is becoming more apparent every day, and it is quite evident that, except in favoured situations, the supply of Pears and Apples will fall far short of the usual demand, nor can we expect a golden harvest of stone fruits, notwithstanding that some kinds, notably Cherries, are now gay with blossoms, and if the weather remain as at present a fair set of fruit may be the result. It must not, moreover, be forgotten that imperfections arising from immaturity of the wood are always succeeded by shoals of fruit dropping shortly after they are set, so that we must not be too sanguine for the present, but endeavour, by artificial aid, to render the necessary protection to the blossoms while there is hope left. On the 15th of what will have to be called the past month when these notes appear, we registered 8° of frost in this low-lying district, and for several mornings afterwards the glass fell to from 3° to 4° below the freezing point, and I have reason to know that lower temperatures have been registered elsewhere. These figures and the fierce rays of sun succeeding them, together with alternate periods of keen east winds, will indicate the importance of using such remedies as are available to counteract the powerful influence that such extremes must have upon the tender organs of fructification. Perhaps the commonest mode of protection, and one that is easily procured anywhere except in the vicinity of towns, is the old-fashioned one of Spruce branches, which should be applied as lightly as possible consistent with circumstances. A very good way of adjusting it is by having upright poles placed against the wall, as described in my last Calendar, having a fishing-net spread over them and fastened at both ends to prevent the material from flapping about in case of wind; the Spruce branches are laid outside the netting and made fast to the poles. The lower portion of the wall is protected by working in a few light branches between the main limbs of the trees. Standard Cherries may be protected by forming a rude screen made of hoops something in the shape of a bee-hive around the tree, which can be covered with thin canvas as a protection against frost and cold winds, and afterwards with netting to save the fruit from being devoured by birds. Judging from present appearances the weather has settled down for a long period of drought, and in light soils plantations of Strawberries will be sure to suffer shortly through want of sufficient moisture at the roots if the surface of the ground be not heavily mulched. It is equally necessary to take the same precaution with heavy or wet soils, which crack on the surface, and thus open up channels whereby the moisture escapes into the atmosphere leaving the earth in an impenetrable and caky condition in which healthy root-action cannot take place in time to be of much benefit to the crop. *W. Hinds.*

**FLOWER GARDEN, ETC.**

**TRANSPLANTED TREES, &c.**—The parching winds that have now prevailed for a considerable time have so dried up recently-planted trees and shrubs, that watering of them has become a necessity; if they are to start into growth without a serious check, one thorough drenching and the immediate application of a heavy surface mulching of litter will probably be all that is needed to establish them in the new soil, after which they are not easily affected by drought. Similar remarks are applicable to recently transplanted Roses, as also to herbaceous, alpine, and rock plants that have been lately moved. Any of these latter yet to be rearranged or divided should have immediate attention, that the spaces remaining may be sown with the hardier

**ANNUALS FOR SUMMER AND AUTUMN FLOWERING.**—Sweet Peas, Mignonette, Lupins, African and French Marigolds, Clarkias, Candytufts, and mand others, are amenable to this mode of sowing any culture. Stocks, Asters, Helichrysums, Zinnias, Dianthus Heddewigii, and Phlox Drummondii should now be sown in a frame, but have full exposure in

mild weather as soon as the seedlings appear. If sown thinly in drills, 4 to 6 inches apart, they will not need transplanting other than to their permanent positions in mixed borders, or for formal line planting for use as cut flowers, for which purpose they are deserving of extended cultivation.

**BEDS AND BORDERS** that are vacant should be got in readiness for planting, and the hardy plants may forthwith be got out. We are here now planting the raised edgings of the beds, some with *Cerastium arvense*, others with *Sedum glaucum*, *Veronica repens*, *Sedum acre elegans*, *Sempervivum montanum*, &c. *Echeverias* are this year with us to be discarded as edgings, and used only as groundwork plants for taller succulents; they are among the best of edging plants, but I have lately imbibed the notion that they have a too artificial appearance when so used; at any rate, the plants named as now being used for edgings have a more pleasing and natural effect. So soon as the edgings are all planted the beds should be marked out to the desired designs, of which I may say that the most simple are the most pleasing. All hardy plants may then be planted as opportunity offers, and much valuable time will thus be saved when the bedding-out season arrives. *Sedum acre elegans* is one of the brightest hardy plants we have for marginal lines, or for forming the framework in embossed, or what is more generally termed "carpet bedding," and this may at once be planted, together with *Mentha pulegium gibraltarium*, *Herniaria glabra*, *Ajuga reptans purpurea*, and indeed all kinds of hardy plants that are suitable, or that can be made available, for bedding purposes, for it is in this direction alone that relief from the pressure of work bedding-out entails can be expected.

**GENERAL WORK.**—The long-continued fine weather has helped to clear off arrears of work that the long winter had caused, so that all roads, walks, verges, and turf should ere this be in perfect order, the final touch of neatness being given by the mowing of the lawn, which now requires to be done before the coarser grasses get long and injure the finer by the exclusion of air, for if this be allowed to happen, the turf will be patchy, and will retain that appearance throughout the season. Frequent rolling and mowing at intervals of from eight to ten days are essential conditions to the production of a smooth velvety turf. Where new lawns are to be formed from seeds there should be no further delay in getting them in. Tread and level the surface, then sow the seeds, and afterwards rake and re-rake the soil to work the seeds in, and complete the process by a good rolling, which till germination takes place will require to be repeated after each frost, otherwise, through the upheaving of the soil, caused by frost, many seeds will perish. *W. Wildsmith, Heckfield.*

#### FRUIT HOUSES.

**VINES.**—The dry spring having been favourable, Grapes in properly ventilated rooms are keeping unusually fresh and good. It will be necessary to look over them once or twice a week for decaying berries, and when a portion of the bunches have been cut the bottles should be cleansed and refilled with fresh soft water, when a general change or turn over may be effected. In ordinary seasons we have to expel damp by means of fire-heat, but this spring we are obliged to close the shutters and keep the room as cool as possible to prevent the berries from suffering through getting too dry. *Lady Downe's*, *Black Morocco*, and *Gros Colmar*, are keeping well, and the latter is now but little if at all inferior to a good *Hamburgh*. To do this fine Grape full justice the Vines should be grown in a mid-season or early autumn-house in which the fruit will be quite ripe by the beginning of September, but the bunches should not be cut before the first week in January, by which time the berries will have lost the disagreeable taste of the soil so often met with in imperfectly ripened and prematurely used examples. Late houses now making rapid progress will require daily attention to dis-budding, stopping, and tying, before the points of the young growths touch the glass. If the semi-extension system of training can be adopted, stop at the second or third joint beyond the fruit, and then allow the first set of laterals to extend until every part of the trellis is evenly covered with foliage. Train the shoots sufficiently wide apart to admit of the full development of the leaves, and allow the leaders to ramble along the back wall. Give the inside borders liberal supplies of tepid water. Shut off fire-heat early and use the syringe freely during the continuance of this bright weather. External borders which have been uncovered since the Grapes were cut in January will now require some kind of protection from drying winds, and to prevent the surface-roots from striking downwards in search of moisture. If the borders are poor they may be well mulched with rotten manure, but if rich and in good condition, fresh stable litter will best answer the purpose, as it will not completely shut out solar heat, and the heavy mulching

will tell better after the Grapes are set. Muscats now in flower will require a high and moderately dry temperature with daily fertilisation to hasten their setting. With this fine weather there will be no great difficulty in running the house up to 90°, with air by day, and if the roots are warm and active the minimum temperature may stand about 70°, or 5° lower on cold nights. We are now thinning Muscats, which have set as freely as *Hamburghs*, and the night heat through the flowering stage ranged below 60°, but we were careful to secure the main point—a temperature of 60° at the roots. Where Vines are languid they may be greatly relieved by the removal of a portion of the surplus bunches before they reach the flowering stage; but in the event of the borders lying low, cold and wet, steel forks, new drainage, and fresh compost, will produce better results than high temperatures, which only aggravate the evils they are intended to cure. *W. Coleman, Eastnor.*

#### MELONS.

As the roots push through the hillocks add thereto some more soil of about the same temperature as the house or frame in which the plants are growing. The stopping, thinning, and tying of the shoots must be regularly attended to now, for if neglected for only a few days the shoots would become overcrowded, which would be a state of things highly detrimental to the general progress and development of the fruits—in fact, such a state of things would tend to retard rather than advance the swelling off of the fruit, inasmuch as the energies of the plants, under such circumstances, would be wasted, instead of the sap being concentrated to its proper function—the development of the fruit and the consolidation of the necessary wood and foliage. Great care must be exercised in the putting on and taking off of air whilst these north and north-easterly winds continue, which, notwithstanding the presence of warm sunshine, are bitterly cold. Where plants are swelling off their fruits, shut up at 90°, with abundance of atmospheric moisture, and run up to 95°, which will be none too high a temperature for plants at this stage of growth. Continue to make successional sowings and plantings where necessary, and see that the linings of dung-frames are properly attended to by removing the partly-spent fermenting material, and replacing it with some hot dung and leaves from the reserve yard, where they had been turned over a couple of times preparatory to being used. *H. W. Ward, Longford.*

#### CUCUMBERS.

Where fine straight fruit is specially aimed at crop lightly, and place the fruit in glasses—specially made for the purpose—corresponding in size with the maximum length of the variety of Cucumber which they encase; give also liberal supplies of tepid liquid manure to the roots as they require it, and shut up early (about 3 o'clock) in the afternoon, using the syringe freely when circumstances necessitate it. Stopping, thinning, and arranging of the shoots will also require considerable attention. A good supply of fruit can be kept up where the demand is not very great with two or three 3-light frames by planting them in succession and cropping lightly. When the second frame comes into bearing thin out most of the old shoots, and induce the plants to make young wood, which will in its turn make a succession to the second or third frame, and so on with each succeeding frame. Make a sowing of *Gherkins* and *Stockbridge* for ridge cultivation. *H. W. Ward.*

#### PLANT HOUSES.

The present will be a very busy season in these, as besides the general overhauling and cleaning to which most plants should be subjected, there is much potting to be done; and the first and most important requiring attention in this respect being the greenhouse hard-wooded subjects, which should be handled with great care. Before any interference takes place with them, it is a matter of the greatest consequence that the whole of the ball is in a properly moist condition, for if not in this state when shifted and surrounded with fresh soil, it is next to an impossibility to get it so after, and the longer a plant can go before being watered when repotted the better. The old practice was to give a thorough soaking immediately the latter operation was carried out, but by so doing the peat becomes so thoroughly saturated, that it is a long time before the delicate hair-like roots can take to it; whereas if not wetted they lay hold of it at once, and the plants, as a natural consequence, start away into free growth. It will be obvious to all acquainted with the cultivation of these, that the peat when used should not be dry, as, if it were, water would of course have to be quickly given; but in potting, the great thing is to have a store of soil in that happy medium when it may be pressed together and feel clean and elastic in the hand, and leave it without sticking or scarcely staining the skin. If it can be had in this state, there need be no hesitation in ramming it tightly around the old ball, which it will then almost form part and parcel of, and prevent a

too rapid percolation of water without the inner portion getting its share. For the choicer kinds of greenhouse plants, such as *Epacris*, *Heaths*, *Azaleas*, and *Aphelaxis*, it is advisable to take out a portion of the more earthy portions of the peat by means of a fine sieve, and to use only the best and most fibry parts, to which a good sprinkling of sharp sand should be added. Great care is necessary to work out the crocks without inflicting any damage by breaking the roots—the principal and most active feeders being generally centred there.

Next in importance to the use of sweet wholesome peat or loam in the culture of plants is the rule of having clean pots, all of which that have been previously in use should be thoroughly scrubbed both inside and out and placed in an inverted position to dry, as when filled before this has taken place, the earth clings to them, and the plants cannot be turned out again without seriously damaging the roots. *Azaleas* and *Rhododendrons* that have been forced, as well as *Cytisuses*, *Coronillas*, and others of that class that have done blooming, should be subjected to a moist growing temperature that they may have every assistance and encouragement afforded them to make their young wood betimes, but before starting them on the way for this the *Cytisuses* and *Coronillas* will require thinning and pruning in. *Calceolarias* of both the herbaceous and shrubby sections need much watching just now in order to keep them free of aphid, pests which it is a difficult matter to eradicate without injuring the delicate leaves. The only way to do this with safety is to fumigate lightly in quick succession for a day or two when the weather is dull, using good shop tobacco for the purpose, which is far more potent than the paper, the smoke from this being hot and destructive to the health of the plants. At the present stage of these a cold, moist frame suits them best, where, if the syringe is used sparingly over them just before closing, the bedewing will be a great help in preserving the foliage fresh, and assisting it to retain that pleasing green colour which is so effective an accompaniment to gay blooms. The present strains of *Cinerarias* are so good that it is seldom worth while to raise them in any other way but from seed, nevertheless it occasionally happens that a few among those so obtained show such extraordinary fine properties that the possessors of them become desirous to perpetuate them, which may be done, and good plants obtained, by encouraging a free growth of the suckers which emerge from the base of the old ones as soon as they have ceased flowering. It will be found that these side-shoots start more readily if the plants are knocked out of the pots and plunged in leaf-mould to a depth sufficient to partly bury the crown, when the side-shoots will form roots quickly, especially if the frame in which they are placed be shaded and the interior kept moist by frequent syringing. In cases where the stock is raised from seed the present is a good time to sow for the main batch, as also *Primulas*—the semi-double varieties of these being so exceedingly serviceable for cutting and general decorative purposes, as to render them of special value in most gardens. Those having really double flowers can only be propagated by means of cuttings, or rather division of the old plants, and to be successful it is necessary to keep these a little dry some time previous to making a separation of the parts, that they may be a little hardened and the sap reduced, otherwise, when a severance is effected, they are apt to rot and be lost. In taking the cuttings it is important to get as much of the base with them as possible, which should be trimmed and freed of all loose parts, and each cutting then inserted in separate pots in sharp sandy soil, and stood in a warm house under the protection of handlights till they strike, which they soon do if duly shaded and kept from flagging by giving an occasional bedewing overhead, but this must not be heavy enough to run into the hearts or to wet the soil much till the wounds are all healed.

**AZALEAS.**—The earlier kinds of *Azaleas* that have been forced and have become denuded of bloom should at once have their seed-vessels picked off, and be placed where they can enjoy a good brisk temperature to help in completing their growth that they may be of service for starting again at the end of the year; and the same with *Cytisuses*, *Acacias*, *Rhododendrons*, &c., all of which require special attention just now to insure good growths and to keep them shapable by the requisite pruning and thinning.

**POT LILIES**, so useful for conservatory decoration, will now be pushing through the soil, at which stage the shoots elongate at such a rate if far from the glass as to cause them to become very long-jointed and weak; to prevent which it is advisable to remove the whole stock to some pit or frame where they can be stood on a damp bottom and have the lights tilted high or removed altogether whenever the weather is suitable. *Lachenalias* like the same kind of situation, as also *Tritonia aurea* and the *Ixias*, all of which are impatient of confinement or artificial warmth, and only succeed well when they can have plenty of air. *J. Sheppard, Woolverstone.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	April 5	Sale of Imported Orchids, at Stevens' Rooms; and of Established Orchids and Bulbs, at the Mart, by Protheroe & Morris.
WEDNESDAY,	April 7	
THURSDAY,	April 8	Sale of Carnations and Picotees, Roses, Shrubs, and Fruit Trees, at 38, Gracechurch Street, by Protheroe & Morris.

WE have already alluded at some length to the experiments made by Dr. SIEMENS and his gardener with reference to the use of ELECTRIC LIGHT FOR FORCING, and we have been furnished by Dr. SIEMENS himself with full particulars of the experiments so far as they have gone. The matter is of such great importance that we revert to the subject for the purpose of showing the manner in which the experiments have been carried out, for the opportunity of doing which we are again indebted to Dr. SIEMENS and his gardener, Mr. BUCHANAN. Our illustration (fig. 75), drawn on the spot, though not strictly accurate, as the Melon-house is a span-roofed house, will at least serve to show the plan of arrangement. The light has been used in the interior of one house, and has also been placed on the outside of a Melon-house between it and a Strawberry-pit, as shown in the figure. The house within which the lamp was placed is a small oblong conservatory, some 24 feet by 16 feet. The lamp was placed at a height of about 8 feet from the floor. In this house the plants nearest to the light were accelerated in their growth by some ten to fourteen days, and in some cases the leaves, as of a Banana, were scorched by the rays. The lamp was used at night in this house for some three weeks, and in it were grown the Arums and Roses exhibited at the Royal Society and at the Royal Horticultural Society. Near to this house are situated the Melon-house and the Strawberry-pit shown in our sketch (fig. 75). Two posts will be observed, the lamp having been suspended, first on the one, then on the other, in such a way that the light fell on one end of the Melon-house and then on the other end, the Strawberry-pit being lighted at correspondingly different parts of its length in the same manner.

The nature and general results of the experiments have been already detailed, but we may mention one case in which the results were very striking: three pots of Potatoes were forced, the advantage being wholly in favour of that grown under electric light by night and solar light by day. The experiment was, however, vitiated by the injury done to the plants, which had to be covered up in the day. With reference to the Melons it was observed that when the light was shifted from one end of the house to the other the progress of the plants which had been subjected to the ray was visibly checked. Another significant circumstance is that leaves grown under the electric light, when deprived of that source of illumination for one night only were unable to bear the sunlight next day but became flaccid as if growth had been imperfect under the electric light and there had been no time to consolidate the tissues or to pump up or to store sufficient water to compensate for the evaporation.

Having seen the actual working of the apparatus and its results hitherto we are more than ever convinced of the great boon which the electric light will in the future offer to gardeners in the dull winter months when heat

and moisture can be controlled, but when the gardener sighs in vain for light. For Cucumbers, Melons, Vines, Strawberries, and various flowers—for all early forcing work, in fact—we feel convinced the light will ultimately prove very beneficial; and even the question of cost (4*d.* to 6*d.* per hour for a light of 1400 candles) need not deter the gardener called on to produce some of his choicest products at the most unseasonable times.

It must be remembered that the light is not likely to be of practical use except in the winter months, for as the sun gets increased power the advantage of the electric light seems to be proportionately lessened. It must also be remembered that the whole thing is in its infancy, and that a series of well devised comparative experiments must be carried out ere the matter can be looked on as anything but a very promising experiment. Melons or Cucumbers, or other annuals, are specially suitable for the experiments, because the whole cycle of growth, from the seed to the seed again, can be watched under the light. Such plants would grow and manufacture as they grow under the light. In the case of a Vine or a Strawberry plant the manufacturing process has been to a large extent got through the season before, and the heat, light, and

the ends near to each other but not touching. A clockwork apparatus ensures the progressive onward movement of the candles at one end as they get consumed at the other, so that the distance between the two points remains the same, although the positive candle is more rapidly consumed than the negative. When the electricity, generated in the manner above-mentioned, traverses the wires, it suddenly comes to a standstill at the end of the charcoal candles; there the two opposite currents, positive and negative, meet, rush at one another as it were, owing to the great affinity of positive for negative. The result of this combination of opposite electricities is called the "discharge" or spark, here represented in the incandescence of the charcoal and the production of light. What was electricity or magnetism is now represented by light and heat.

The whole thing is a most curious exemplification of the relation between "forces." First the sun-force produced the wood, which ultimately became coal, and in which the gas is imprisoned. The gas thus indirectly produced by sunlight and sunheat is liberated by heat in the furnaces of the gasworks, and made to work the engine. Great mechanical force is thus produced: that force transmitted to a magnet induces two opposite electric currents, which, recombining, reproduce, as it were, the sun-

FIG. 75.—FORCING BY THE ELECTRIC LIGHT.

moisture do but set the plant to work, and in so doing it, at least at first, avails itself of the stored material made the season before.

The machine by which the light is produced at Tonbridge Wells is worked by a small gas engine, which latter is so very convenient in its action that we are surprised such engines are not more frequently employed where gas is to be had. There is no lighting fires, getting up steam or stoking—the engine begins to work immediately.

As to the electric light it is not needful for us to go fully into a matter that could only be explained by a professed electrician, and comprehended by one familiar with that branch of science. Suffice it to say that the principle of the light rests upon the sudden combination of two opposite electrical currents and the conversion of one sort of "force" into other forces—magnetism, or magneto-electricity into heat and light. There is a magnet which by "induction" imbues with its own properties a second electro-magnet made to revolve with great rapidity, by means of the gas engine, in close proximity to the first. The result is that the electro-magnetic force is greatly intensified, and is made to travel along the conducting wires to the lamp, placed at any convenient distance—the "positive" current by one wire, the "negative" by the other. The lamp consists of two charcoal "candles," placed with

light and sunheat from which they were primarily derived, and now in their turn serve to help the plants submitted to their light to grow and give out and drink in gases, as the plant from which the coal was produced did in its time, how many ages ago we cannot even guess.

—NEROPHYLLUM ASPHODELOIDES.—Probably because the plant had never before been a candidate for the honour, this very old inhabitant of our gardens did not receive a First-class Certificate till it was shown in June last, before the Floral Committee, by Mr. G. F. WILSON. It is a plant of the Colchicaceous division of the great Lily family, with a tufted habit and very numerous crowded roughish leaves. From the centre of the tuft rises a tall flower-stem with small linear lance-shaped bracts below, and a dense many-flowered raceme above. The flowers are whitish or yellowish-white. As our figure shows (fig. 76), it is a stately plant for the herbaceous border, though it is said not to flower freely. Mr. WILSON, however, seems to have found the secret, and is too good a plantsman not to reveal his method of growing the plant. It is a native of the South-eastern States of North America, whence it was introduced as long ago as 1765.

—CROTON WARRENI.—Under this name Mr. B. S. WILLIAMS proposes shortly to issue a fine Croton with long narrow leaves twisted like a corkscrew; the ground colour is dark green edged with crimson, and with irregular orange blotches. It is a robust-looking variety.

FIG. 76.—XEROPHYLLUM ASPHODELOIDES, (SEE P. 432.)

— BOTANIC GARDEN SEED LISTS.—We have received catalogues from the Botanic Gardens of Vienna, St. Petersburg, and Palermo.

— EASTER MONDAY AT SOUTH KENSINGTON.—The Royal Horticultural Society's Gardens were thrown open to the general public on Easter Monday, at an admission fee of 2s. each, and 10,089 persons passed through the turnstiles, so that the Society's treasury was benefited to the extent of £84 1s. 6d.

— ANEMONE BLANDA.—Mr. INGRAM, writing from Belvoir, says:—"I do not know a more charming spring flower than *Anemone blanda*; of a more intense shade of blue and preceding in flowering *A. appennina* by at least a month, for the earliest section of the spring garden it is invaluable. It is most fortunate that for purposes of propagation it produces seed freely, and its seedlings exhibit a decided tendency under cultivation to vary from the normal type, but still preserving their precocious habit. Amongst the seedling varieties I possess are flowers almost twice the size of the ordinary form, and varying in colour from white, light blue, to the intense hue of the parent: some of these I send for your inspection."

— THE EFFECTS OF THE WINTER ON VEGETATION.—The Scientific Committee of the Royal Horticultural Society, having appointed a committee to collect evidence and report the effect of the past severe winters and cold summer on trees, shrubs, and plants, will be glad of the co-operation of all horticulturists interested in the subject, whether members of the Society or not. Forms are in preparation for filling up, and may be had on application to the Secretary, South Kensington.

— DEFOLIATED VINES.—Those of our readers who may be interested in the fate of the Vines which were defoliated at Chiswick last autumn will be pleased to hear that the canes in question are breaking about the same as usual.

— SYDNEY INTERNATIONAL EXHIBITION.—A telegram has been received at the International Exhibition Offices, Castle Street, Holborn, stating that a Gold Medal has been awarded to Messrs. J. B. BROWN & Co., 90, Cannon Street, London, for their galvanised wire netting.

— THE LATE MR. MAXWELL.—"A few weeks ago," writes Baron VON MUELLER by the last mail, "death carried very suddenly away Mr. G. MAXWELL, at King George's Sound. He was found dead in his bed. Although he felt ill the evening before in Albany, he rode back to his place in the country, commenced his work in the morning, and sent a native away on some trivial business only an hour before. He was found to have expired from apoplexy. He had attained the age of seventy-five years. Only two years ago I made long journeys with him over rough country for several days on horseback to collect plants and seeds, and he was then as enthusiastic as ever, being able to endure great fatigue till the last of his bush life. More than thirty years ago he conducted Mr. DRUMMOND through the Stirling ranges in the journey which proved so memorable in the discovery of many splendid plants. He was nearly always in the bush, and engaged in procuring seeds, botanical and entomological specimens, in which pursuit he is succeeded at King George's Sound by Mr. W. WEBB. After the death of his wife he lived even without a servant in the roughest style, quite by himself. Encouraged by myself he undertook several extensive journeys over then untrodden ground, eastward as far as the Great Bight, and thus found many new plants, and enabled us to extend the known limits of the range of many rare species, as recorded in the *Flora Australiensis*."

— THE SAN DONATO SALE.—Prince DEMIDOFF's gardens at St. Donato, near Florence, are among the most richly endowed in Europe. For some time they were under the charge of Mr. GOODE, who had been with Mrs. LAWRENCE at Ealing Park, and at one time a catalogue, which was in its way a model, was prepared by Professor PLANCHON, now of Montpellier. When at Florence at the time of the Botanical Congress in that city, many of our readers had the opportunity of inspecting these gardens, and we were at that time enabled to give illustrations of some of the fine specimens it contained. The

collection was got together by Baron HÜGEL, and is contained principally in one long range, 400 metres long by 8 to 10 metres in breadth. In fulfilment of what seems to be inevitable destiny, the contents of this fine garden are to be disposed of by public auction at Florence, from the 23d of April to the 4th of May next, and a catalogue has been drawn up by M. LUBBERS of the Botanic Garden, Brussels. As to the catalogue we cannot more appropriately describe it than by citing SHERIDAN's description:—"You shall see a beautiful quarto page where a neat rivulet of text shall meander through a meadow of margin."

— DAVIDSONIA PRURIENS.—Respecting this curious and beautiful plant, figured at page 819, vol. vii., 1877, we find the following interesting note in a recent number of the *Belgique Horticole*:—"The plant assumes the dimensions of a tree, and produces a succulent fruit about the size of a Magnum Bonum Plum. The flavour is somewhat rough, but excellent preserves are made from it."

— MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—At the very successful spring show held by this Society on March 17 and 18, the Society's Silver Medal was awarded to William Leach, Esq. (Mr. Swan, gr.), for a miscellaneous collection of plants; and Cultural Certificates for Dendrobium crassinode to Mr. William Leach; Hyacinths, Messrs. Dickson, Brown & Tait; Hyacinths, Messrs. Wm. Cutbush & Sons, Highgate; Cyclamens, Mr. B. S. Williams, Holloway; miscellaneous plants, Messrs. G. & W. Yates; miscellaneous plants, Mr. S. Schloss, Bowdon; Lilacs, Lily of the Valley, Violets, and miscellaneous plants, Messrs. John Standish & Co., Ascot.

— ORCHIDS IN FLOWER.—Mr. BULL has an especially fine display of Orchids in flower just now, of which we append a list. Some of the varieties of *Odontoglossum triumphans* are of great beauty, but perhaps the most noteworthy plant of all is a grand specimen of *Ada aurantiaca* with nineteen spikes of flowers:—

Acropera luteola	Masdevallia Harryana
Ada aurantiaca	.. corulescens
Anguloa Clowesi	.. splendens
Calanthe Masuca	.. lilacina
Cattleya Loddigesii	.. Lindenii
.. Mossie aurantiaca	.. peristeria
.. species nova	.. oculata
.. Trianae	.. Veitchiana
.. splendens	.. violacea
.. tyrianthina	Odontoglossum Chestertonii
Cyclogyne Lowiana	.. cirrosum
.. ocellata	.. Klaborhorum
Cymbidium eburneum	.. citrosimum
.. maculatum	.. roseum
Cypripedium barbatum pictum	.. cordatum
.. Boxalli	.. crispum (Alexandrae)
.. Dayanum	.. roseum
.. Harrisonianum	.. gloriosum
.. villatum	.. superbum
Dendrobium chrysoxum	.. Hallii
.. crassinode Barberianum	.. luteo-purpureum
.. Cambridgeanum	.. maculatum
.. crystallinum	.. Domatum
.. den-iborum	.. membranaceum
.. Devonianum	.. nebulosum pardinum
.. Fendleyanum	.. pardium
.. Freemanii	.. Phalenopsis
.. luteolum	.. Pescatorei
.. nobile	.. nivale
.. Wallichii	.. Roezii
.. Pierardii	.. album
.. sulcatum	.. seeprium
.. thyrsoiflorum	.. triumphans, several vars.
.. Wardianum	Occiduum Cavendishianum
Epidendrum cuspidatum	.. cheiropodium
.. luscatum	.. cucullatum
.. macrochilum	.. Forbesii
.. paniculatum	.. fuscatum
Lycaste Harrisoniae	.. Kramerianum
.. Schilleriana	.. luridum
.. Skinneri	.. reflexum
.. purpurata	.. sarcodes
.. rubella, and many vars.	.. serratum
Masdevallia amabilis	Præius Plumetii
.. bella	Pleione humilis
.. civilis	.. tricolor
.. Estrade	Sophrontites grandiflora
.. ignea	Vanda striata, a rare species.

— LELIA FLAVA is now in bloom at Mr. B. S. WILLIAMS' at Holloway. Its peculiar yellow flowers, with their narrow oblong segments, render this a valuable plant for variety sake.

— POTATOS FOR IRELAND.—The shipments of Potatos from the Clyde to Ireland for the past five or six weeks have been beyond all precedent. The tubers have been received in Glasgow and Greenock from all parts of Scotland, the remote Highlands contributing thousands of bags, these coming sometimes from places previously known only as localities where the native supply was so small as to require supplementing. It is feared that in certain remote

parts the suicidal policy has been followed of disposing of the seed Potatos to the merchants; and if this is the case, the scene of distress may before long be transferred from Ireland to the Highlands of Scotland. *Irish Farmers' Gazette*.

— ARISMA CONCINNUM.—Thirty-two years ago this handsome Aroid was discovered in the forests of the Sikkim Himalaya, at elevations of 6000 to 10,000 feet, by the present Director of the Royal Gardens, Kew. The credit of its introduction in a living state to our gardens is due to Mr. GAMMIE, formerly of Kew, now of the Cinchona plantations at Darjeeling. The solitary leaf has an erect petiole, from 1 to 2 feet in height; its base sheaths the scape, and is itself sheathed by successively longer membranous bracts. The blade of the leaf is made up of ten or twelve lanceolate, entire, light green leaflets, which radiate from the top of the petiole like the spokes of a wheel. The spathe is convolute, tubular at the base; its upper portion bent over at the mouth, and gradually narrowed into a tail-like appendage about 3 inches in length. The spathe of the female plant is longitudinally barred with white and green, the latter colour being replaced with blue-purple in the male. This species is now in flower in the T range at Kew.

— CALCUTTA BOTANIC GARDEN.—We regret to hear of the decease from cholera of ADOLF BIEMANN, the Curator of the Royal Botanic Garden, Calcutta.

— PITTOSPORUM TOHRA.—"G., Bath," writes:—"This New Zealand plant has here stood the last winter unprotected, and uninjured." We may add that it generally does so on the south coast.

— MR. EDWARD HEWITT.—The death is announced of Mr. EDWARD HEWITT, of Eden Cottage, Sparkbrook, Birmingham, one of the oldest, best known, and most respected judges of poultry.

— PHEA POLITA.—In our recent notice of this noble Spruce we omitted to state that we had received cones from Messrs. CHARLES LEE & Son, and which had been produced in their Feltham nursery. Some, indeed, were exhibited by Messrs. LEE before the Royal Horticultural Society. Messrs. LEE, we are glad to learn, have raised numerous seedlings from these cones. It is a noble-looking species, and perfectly hardy.

— EFFECTS OF THE WINTER ON PLANTS.—The Hon. Mrs. HOPE informs us that in her garden at Belmont, Murrayfield, Mid-Lothian, a large tree (on a south wall) of Loquat has been very hard hit this winter, as has been Blue Gum, *Garrya elliptica*, and *Acacia affinis*—the latter may come away from the ground; while on the same wall a *Magnolia conspicua* is quite safe and covered with flower-buds. *Choisya ternata* has stood quite well, and *Stantonia latifolia* (which had had a branch of Spruce Fir covering it), though cut by the frost, is breaking well.

— ODNTOGLOSSUM PESCATOREI.—We have received through Messrs. VEITCH some blooms of this useful Orchid, from the gardens of Mrs. BURNLEY HUME, at Winterton, near Great Yarmouth. The plants have been in bloom throughout the winter in a greenhouse at no higher temperature than 40°, and Mr. MURRELL, the gardener, states that their cultivation demands no greater skill than that required by a *Pelargonium*. No two flowers of those sent us were alike in their markings.

— THE GENUS CROCUS.—A good monograph, on no matter what subject, is always a satisfying and a satisfactory performance. It is an evidence of hard work thoughtfully directed—always a pleasant thing—while its well-arranged, carefully manipulated details, are of cardinal importance to the student. Such a monograph lovers of the *Crocus* may look for at the hands of Mr. GEORGE MAW. A specimen sheet is before us, a goodly quarto, with a well-executed engraving of a "chine" in the Pyrenees, and a thoroughly useful, well-drawn coloured plate, representing the structural details of one of the species. The text comprises the whole history of the species—its name, position in the genus, literary history, synonymy, diagnoses, description, geographical distribution, life-history, and garden culture. When completed the work will consist of

two royal quarto volumes, including about eighty coloured plates from drawings by the author, and some five hundred pages of letterpress, with numerous wood engravings. The number of species is about seventy—double the number that HERBERT knew in 1847. Of these the majority are in cultivation in the author's garden, while he has himself collected a large portion of them in their native habitats. We await with great interest the completion of this excellent monograph.

— ANCHOMANES HOOKERI.—In the warm compartment of the T range at Kew there is a good flowering specimen of this peculiar and beautiful Aroid, which, on account of its striking foliage and the colour and graceful form of its spathe, is certainly worthy a place in any collection of stove plants. The slender, prickly petiole is 3 feet in height, and bears on its summit the horizontal blade, about 3 feet in diameter; this is divided into three primary divisions, which are again cut up into several leaflets, the largest of these being toothed. The scape is also prickly, like the petiole, and a little shorter than it. The spathe is of a pale purple colour. A native of Western Tropical Africa.

— THE BORDER COUNTIES FLOWER SHOW, which will be held at Carlisle at the same time as the Royal Agricultural Show—opening on the Tuesday and closing on the Friday, July 13 to 16—promises to be very extensive. There will be upwards of 1000 feet of marquee and 4000 feet of tabling. The show of Roses in particular is expected to be one of the finest ever held out of London. All the principal Southern horticulturists have promised to compete.

— BASINGSTOKE HORTICULTURAL SOCIETY.—The fourth exhibition of this Society is announced to be held on August 24, at Goldings, the residence of S. FIELD, Esq.

— NEW GARDENS.—The number of visitors to New Gardens on Good Friday was 15,875; and on Easter Monday, 32,753.

— ANECTOCHILLI.—These are so difficult to manage that, beautiful as they are, we seldom see them. Mr. WILLIAMS lately showed us a frameful in beautiful order, comprising several of the species. Is it that they are usually too much coddled? At any rate Mr. WILLIAMS is not afraid to give them plenty of air.

— THE PEA WEEVIL IN CANADA.—It is estimated that the damage done by the Pea weevil last year in Middlesex County, Canada, was not less than 100,000 dol., and the local agricultural society, believing that the total omission of one crop would give at least temporary riddance of the pest, "strongly recommend the Legislature of Ontario to pass an Act permitting County Councils to prohibit the sowing of Peas in those counties that are infested by the bug." *New York Tribune*.

— PUBLICATIONS RECEIVED.—*The London Market Gardens*. By C. W. SHAW (37, Southampton Street, W.C.)—*The Indian Forester*.—*Seventh Annual Report of the New Jersey State Board of Agriculture for the Year 1879*.

— THE WEATHER.—General remarks on the weather during the week ending March 29, issued by the Meteorological Office, London:—"The weather, though cloudy, hazy, or foggy at times, has been generally fine, bright, and very dry over the whole country. The temperature was equal to the mean in "Scotland, W." and "Ireland, N.," and slightly above it in "Ireland, S.," but in all other districts it has been a little below the mean value. The highest of the maxima (63 to 65°) were registered at most stations on the 25th or 26th, while the thermometer very frequently fell during the night-time below 30°, and at Rothamsted in the early morning of the 29th reached the very low reading of 21°. The wind until the 28th was generally moderate from east in the south, fresh from south-east in the west, and light from the southward in Scotland. Towards the close of the period, however, very variable airs were prevalent all over the United Kingdom. The rainfall was scarcely measurable in any district."

— GARDENING APPOINTMENTS.—Mr. RICHARD SPINKS, late Gardener to W. L. CHILDS, Esq., Kinlett Hall, Shropshire, has been appointed Gardener to Lady HENRY SOMERSET, The Priory, Reigate, Surrey.

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 403.)

## Home Correspondence.

**Gardeners' Troubles.**—Since writing the Calendar on hardy fruit for the present week, we are again visited this morning (March 29) with a sharp frost, accompanied by a dense fog, which must tell disastrously on the feeble blossoms of ill-ripened wood struggling between a roasting day temperature and drying winds and the chilling effects of dense fog and frost. The glass fell with us on the date above mentioned at 6 A.M. to 25°, or 7° of frost. The weather is everything that can be desired for pulverising and preparing the ground for the reception of all kinds of seeds, and gardeners may look forward hopefully to a good supply of vegetables for the forthcoming season. But, alas! for those poor enfeebled trees upon walls depending for protection upon such *impromptu* shelter as can be rendered by means of Fir branches and other contrivances of a similar nature. Really the summing up of the whole business is, to say the least of it, a vast amount of labour, which means money all but thrown away, so far as any return that we have had of late years, to say nothing of the first cost of walls, trees, and formation of borders, the material of which amounts in many cases to a good round figure. I think upon the whole there is no remedy likely to yield satisfactory results short of glass protection, and I do not think there is any suggestion having taken a practical shape before the horticultural public to equal that given in the *Gardeners' Chronicle* of May 29, 1879, at p. 624, by Mr. Henry Howlett, who, being a practical gardener himself, knows how important it is to combine the greatest number of advantages to the gardener at the lowest minimum figure consistent with appearance and durability. *W. Hinds.*

**Artificial Lighting.**—An elucidation has happened to me on the subject of forcing by electric light. Why should not other and cheaper lights have a considerable effect on vegetation? In my parlour I have a lovely group of *Crocus* blooms in water, which scarcely open in the daytime, but when the gas is lighted in the evening out they come as in sunshine. [Effect of heat. *Eds.*] In November last I brought two Strawberry plants out of my greenhouse that were flowering for the second time, having been forced in May. They were in bloom, and had a fruit or two colouring. They were placed on the sideboard at the farthest end of the room from the windows in the day, and were placed on the dining-table at night under the gas. They lasted three weeks, in which time they set and ripened, every fruit with a very good flavour and colour, and the leaves were quite fresh at the end of this time when they were turned out-of-doors. Many ladies who partook of the fruit when calling, can testify to the delight they experienced. Will some rich amateur have the gas laid on outside his forcing-house next winter, and enlighten the public on the results? *C. Lee.*

**Spiræa palmata.**—Lovers of herbaceous plants who do not possess this would do well to add it to their collection. The foliage alone should be a sufficient inducement, and the flowers add much to its beauty. I find them retain the colour longer by being planted in partial shade. There can be no doubt of its being hardy, as it has stood the two past winters here in a shrubbery border without protection, and it is now shooting up strong. *W. Divers, Winton, Maidstone, March 27.*

**Cultivation of *Molinia cærulea*.**—In reply to some of "Ebor's" questions, I beg to say that the grass can be best cultivated as a material for the papermaker (its pernicious character at certain seasons renders it unfit for feeding purposes) by planting the roots a foot, or at the most 18 inches, apart every way. Any waste ground may be made use of, by preference undrained, seeing that the more moisture there is in the ground the longer and stronger is the fibre in the flowering stem, which is the part best adapted for manufacture. The crop should be collected in July, or early in August, and may be gathered as children gather rushes. The flowering stem gives way very readily just above the only knot, so that the material would appear in the market without any knots. Papermakers will be able to appreciate this very great advantage. As the grass attains its greatest luxuriance in the open and wet parts of woods, proprietors in planting might form alternate strips of wood and grass, the former being on the higher and drier ground, the latter on the low and wet places. If the planting take place in October, I believe a crop might be got in July or August, and that for a series of years, provided the leaves remain untouched, as they would be by the method of collection I propose. If I mistake not, it would take several years to raise a crop from seed, but as the plant is largely distributed, there need be no difficulty in obtaining roots. There is not the slightest doubt that this is the only crop

which could be raised on many of our waste lands as they at present exist. The 6,000,000 acres in Ireland referred to by the *Times* correspondent might be made use of in this way, with advantage to the country and the paper manufacturer. I shall be glad if I can give any further information in regard to this matter. *A. Craig-Christie, Edinburgh, March 30.*

**Trapa natans.**—Although one of the most interesting of aquatics, and a cultivated edible fruit in the South of Europe under the name of Chataigne d'eau, this plant is rarely to be seen in garden aquaria. Its seeds are peculiar, and have been called "Water Caltrops," since the seeds as they rest on the ground always present a spine upwards, as in the caltrops formerly used in warfare to impede the progress of cavalry. Some weeks ago Messrs. Vilmorin-Andrieux, of Paris, kindly sent me seeds of this plant, and as the germination of these is rather peculiar, I beg to send a not respecting it. The first evidence of germination is the protrusion of a white tigellum, which grows erect, its length varying according to the depth of the water. In shallow water the tigellum bends horizontally on reaching the water level, and from the angle the true plumules rise. From the portion beyond the plumules rootlets are protruded, which gradually take hold of the soil below, and eventually the tigellum decays as the roots acquire the power of supplying the full supply of nutriment. An excellent wood engraving of the plant was published in the *Gardeners' Chronicle* (see p. 213, vol. x., 1878). *B.* [The full history of the germination, with numerous figures, is given in the *Annales des Sc. Nat.*, 3d ser., p. 9, t. 12—15. *Eds.*]

**Sussex Trug or Trug Basket.**—Mr. Shirley Hibberd asks, "Why trug?" and then proceeds to answer the question himself. As Sussex is my county I resent the slur of bad pronunciation. "Why trug?" Because that is the name by which it is known among the people of Sussex, and handed down to us by our fathers and forefathers. Trug, not truck; for truck, as applied to our trug, is a foreign innovation. We of Sussex will not truckle to London. If London is the salt of the earth in the way of pronouncing words properly, why do the Cockneys go to 'Amsted in a wan? As to the people of Sussex not being able to click the *k* properly, such an assertion is wrong. We all like our own names. As trug is a Sussex basket so let it remain. *Henry Eldridge, The Gardens, Chesterford Park, Saffron Walden.* [Our correspondent further sends us some rhymes, which we do not deem it necessary to publish. He reminds Londoners that the word "trug" rhymes with the name of an insect sometimes found in London beds. *Eds.*]

—The German word trug is the imperfect of the verb "tragen," to bear or carry. The "trug basket" is, therefore, a basket to be used for carrying anything in.—*Anglic, a hand-basket. G., Bath.*

**Broccoli and the Frost.**—All through this neighbourhood the complaint is a general one, that nearly all are killed. The sorts planted here were Veitch's Autumn and Winter, all dead; Adams' Early, all dead; Daniel's King, and Hammond's Imperial, very few escaped; Cattell's Eclipse, two-thirds dead; Carter's Champion, and Burghley Champion, about equal, but most of them are killed; Purple Sprouting Broccoli, two-thirds dead. All other sorts of greens have been much injured. Brussels Sprouts were not hurt, but a slight crop; Early Ulm Savoy was not injured, while Cottager's Kale were more than half killed. Of the Green Curled or Scotch Kale none were killed. This is a very nice sprouting green, and in a season like the past invaluable for garnishing purposes when Parsley is scarce: an old Cabbage bed gave us a good supply till after Christmas. Many growers make a mistake in destroying the bed after the Cabbages are cut. After forty years' experience I find it of great advantage to leave them till the ground is wanted for another crop and other greens are more plentiful. A great many Cabbage beds, planted for the spring, have all been cut up, and plants are very scarce and weak. This failure, added to the loss of the Broccoli crop, must seriously affect the supply of vegetables for some time to come. The soil here is a light sharp loam, and rather dry; the aspect due south and sheltered. *W. Divers, Winton Place, near Maidstone.*

**Aaron's Rod** (see p. 408).—Miss Pratt in her work on *Wild Flowers* gives the scientific name of Aaron's Rod as "*Solidago virgaurea*," "Woundwort," and the only British species. "The genus derives its name from 'solidare,' to unite in healing wounds." It is also mentioned by Gerard. But has not the name "Aaron's Rod," and also the picturesque distinction of "High Taper" been applied to the common Mullein, so familiar in old gardens? There is an interesting bed of *Solidagos* in the Botanical Gardens, Edinburgh, where the writer verified last summer an old favourite, feathery and golden-yellow, as *S. viscosa*. It is common in

farmhouse gardens in the Midlands, and the colour is especially pure and beautiful. *H. M. E., March 29.*

—We had a plant known by this name in our garden at Sedbury Park, West Gloucestershire: I believe it was a variety of the *Lysimachia vulgaris*. The flowers were of a deep golden colour, growing in great quantities on a strong upright stem. It had a much more sturdy growth than the ordinary wild plant. I have never seen it elsewhere, unless in the herbaceous ground at Kew [and along the towing path. *Eds.*] *G. E. O.*

**Acalyphas as Table and Room Plants.**—No plants of modern date present greater advantages to the gardener who has a stock of plants to propagate and grow annually for table decoration and house furnishing than these *Acalyphas*. They are easily and rapidly grown, as all plants that are employed for decorative purposes in winter should be, and they have a charming effect when the colour is well up in the autumn. The three varieties that we grow here, viz., *macrophylla*, *musaica*, and *Macafeeana*, bear large massive-looking leaves of a reddish-chocolate tint, which renders them amongst the most stately subjects that can be used for the centre of a small table or arranged in conjunction with groups of other plants. Plants that are intended for special decorative purposes are best cultivated with a view to simplify the work of arrangement hereafter. For instance, if decoration is carried out on an extensive scale, a number of plants should be grown in pairs to match, so that a properly balanced arrangement can be effected with the least amount of trouble. Odd plants of anything seldom work in harmoniously except as isolated objects standing by themselves or in forming the centre of a group. Another point of importance to be kept in view is the size, colour, and variety of the vases to be used. A plant may be splendidly grown and richly coloured, and yet be a ridiculous choice as a table or room plant. No man with half an eye would think of putting one of these beautiful *Acalyphas* in a vase of the same colour or in a room where the predominating colour tended to the same shade, but given a silver vase and a light ground-work, either white or something approaching white, with the surroundings also tending to a light shade, and you produce an effect which few plants will surpass. *Acalyphas* are raised from cuttings and from eyes. The plants are not hardy enough to stand the atmosphere of a room for long without suffering, but by way of compensating for this defect the tops root freely and the stems, cut up into small pieces below every eye, take root in a short time either by inserting them singly into small pots filled with sharp propagating material, such as is ordinarily used, or by putting half-a-dozen or more into a 6-inch pot. The pots containing the eyes or cuttings should then be plunged in a gentle bottom-heat, where fermentation has not at any time become violent, and where the material has not ceased to give off a gentle steam when the lights are closed; here they will take root in a fortnight or three weeks, and be ready for potting off into 60-sized pots or those of a size larger, according to the strength of the plants. Plants propagated from cuttings any time during the month of April, or even early in May, will make fine samples by the end of the season. They require generous cultivation, and a stove temperature with shade during the growing season. Towards the end of August the shade should be gradually reduced, and ultimately dispensed with altogether, in order to have the plants fully coloured early in the autumn and hardened sufficiently by a free admission of air, so that they will stand the wear and tear of furnishing treatment without receiving permanent injury. *W. Hinds.*

**Charcoal Dust.**—Last season I applied a good dressing of charcoal-dust to some of my Peas at the time of sowing. These grew very strong, and resisted mildew entirely, while those sown in the usual manner were a total failure, or nearly so, the mildew attacking them as soon as they were in flower. The charcoal I used was the refuse of chemical works, which can be obtained almost anywhere at little trouble or expense. Charcoal decomposes so slowly that it ought to be used in as fine a state as possible, otherwise it will not decompose at all, unless directly exposed to atmospheric influences, and then so slowly as to be of very little benefit to fast-growing plants or crops. It is well known that a small piece of charcoal will remain in the earth unchanged for years. Although I am an old subscriber, I do not recollect seeing this subject discussed in your pages, and I think that it would be interesting to your readers if some of your correspondents would kindly give the results of their experiments upon the growth of plants with charcoal, as it is such an essential element in the physiological economy of plants. *A Pembrokeshire Gardener.*

**Chimonanthus, Non-flowering.**—As it has been suggested by your correspondent, on p. 372, that it would be interesting to know how the above has flowered in other districts than his own, let me

say that here (about 12 miles south-west of Basingstoke) I have two good-sized plants of *Chimonanthus fragrans*, and have not had one flower this season. *Magnolia Exmouth* var. has nearly every point dead for several inches, although sheltered. *H. W. Warren*.

— This plant has failed to bloom here this season. It bloomed profusely last season, and has a quantity of old fruit still hanging to the tree with perfect seeds in them. I have never succeeded in striking cuttings of this plant, but this difficulty is of very little importance, as it is easily raised from seeds; and if any of your readers desire a few I shall feel it a pleasure to send them. *W. Bishop, Taversham, Norwich*.

**Hardiness of *Lilium giganteum*.**—I was somewhat surprised to find, after such a severe winter, numbers of this fine Lily coming up strongly through the soil (a stiff loam approaching clay) in the well-furnished gardens of J. H. Oakes, Esq., of Newton Court, near Bury St. Edmunds. Each of the patches there are literally capped with a layer of soot, as Mr. Oakes had discovered that the snails and slugs were exceptionally fond of this fine Lily. Many of the shoots are of flowering size, and will have a magnificent effect among the shrub masses, and herbaceous plants, among which they are placed. Quantities of *Lilium auratum* were also left out without any protection, and were coming through on March 16. These looked healthy, though not very strong. Three years ago we tried a hundred bulbs of *auratum* in a lighter soil at Hardwicke—within a mile of Newton—and the frost or the slugs, or both, made an end of them, though on the same border we have one of the finest rows of the common white *Lilium candidum* to be seen anywhere. *D. T. Fish*.

**Camellias and Azaleas Out-of-Doors.**—The past winter has been severe enough to try the hardiness of most plants, and I am glad to find that Camellias and Azaleas have stood the cold and intense frosts better even than the Sweet Bay and other evergreen shrubs, for while many of these are cut about and sadly disfigured the above-named plants appear little the worse. The Azalea seems the harder subject of the two, as one we had turned out last spring has all its leaves as fresh and green-looking and free from injury as any of those in the houses. Its present condition may, and no doubt is, in a measure, owing to the exceeding stillness of the weather and the somewhat sheltered situation in which it is placed, as cutting winds cannot get at it, and yet near by *Laurustinus* have suffered much and *Euonymus* are killed altogether, although just as favoured in every respect. Azaleas may, therefore, I think, be regarded as the most enduring of the three, and any one having old spare plants would do well to plant them out for cutting from, as they would come in late for that purpose and save the necessity for disfiguring those in pots. The Camellias alluded to are growing on a north-west wall, where they have not yet had a fair chance owing to having been disturbed in having been dug up from a border in a corridor, from which they were taken when of large size without a particle of soil, and laid in for some time during alterations till their present position was ready for them. From this disturbance they have not yet fully recovered, but for all that frost has had no bad effect on them beyond browning a few of the older leaves, as the buds are plump and fresh, and the young foliage, wood, and bark too in the same satisfactory condition. In another part of the grounds we have a plant of the single kind that has been out many years, and if it were only for the sake of their deep glossy leaves Camellias are quite worth growing in the open; but besides the richness and beauty of these, they expand flowers in districts where the spring is not ungenial, and the position is such as to afford them some amount of protection. In Devonshire they do remarkably well, as also in Mr. Rogers' nursery near Southampton, and the wonder is that a shrub so hardy, and which has been so long in the country, should be almost entirely confined to greenhouses, when, so far as growth is concerned, it will do just as well outdoors. *J. S.*

**Potatos.**—The time to plant Potatos is upon us, therefore it behoves all growers to examine their seed and ground and make every preparation they can, so that nothing will interfere to prevent the work being expeditiously finished. I am aware that a great number of Potato growers consider from the middle to the end of April the best time to plant, but unless the weather is exceptionally unfavourable I always endeavour to finish by the end of March. We did all our planting last year in that month, and I believe all will admit that a worse season for early planting can hardly be expected, but looking at the bad crops around us—most of which were planted late—we had every reason to be satisfied with the returns our early planting gave us. I am of opinion that nothing tends to court and encourage the Potato disease so much as strong manure used at the time of planting, as it was patent to all last year

in this district that where the greatest quantity of manure had been used the disease appeared in its worst form, and destroyed the crops to such an extent that the sound tubers lifted were less in quantity than the seed planted, whereas those grown with little or no manure to a great extent escaped. We see numerous advertisements and reports relating to various artificial manures specially prepared for growing Potatos entirely free from disease, and we have frequently brought to our notice testimonials from gardeners and others giving such wonderful accounts of the quantity and quality of Potatos quite free from disease grown by the aid of one or more of the said manures, that one is tempted to enquire why the good things named in these testimonials have not been introduced to the notice of the people in Ireland in order to lessen the distress now annually borne by the poor through a partial or total loss of the Potato crop. What has become of *Salus*, about which so much was written some time back? I am afraid it has proved similar to other disease annihilators that we hear of—worse than useless. To grow Potatos of the best possible quality, and the least liable to disease, I find no treatment so suitable as planting medium-sized tubers entirely without manure in a light soil, newly trenched, out of which the tubers come with skins as clean and smooth as note-paper. Snowflake, grown in this way, forms medium-sized tubers of splendid quality, but grown in rich land the crop is enormous, but flavour shocking. I have heard of Potatos being so strong that pigs refused to eat them, which is not to be wondered at, considering the quantity of dung some people use, simply because they consider a large Potato denotes good culture—a mistake often fallen into by judges; but I maintain that to grow a good one is of more consequence, and am persuaded that if growers would use less manure the disease would be less frequent. *A. L. H., Norfolk*.

**Mr. Carmichael's Seedling Azaleas.**—On calling at Newton Court, the seat of J. H. Porteus Oakes, Esq., near Bury St. Edmunds, I was much struck with the novelty and beauty of some of his seedling Azaleas. Mrs. Carmichael, already in commerce, is a decided hybrid between *amœna* and *Stella*. It retains a good deal of the character and size of *amœna*, with somewhat of the substance, colour, and size of *Stella*. Mr. Carmichael is also a decided cross between *amœna* and *Flag of Truce*. Another decided step has now been made by using the pollen of the fine double variety, *President Edward de Walle*, a fine double rose-coloured variety, richly marked with crimson on all the petals, on Mrs. Carmichael. Several of the plants from this cross are now in flower. They vary in colour from the lightest rose to the richest purple, two of them being so dark as to look as if they had a dash of blue in them. The flowers are mostly double or semi-double, of small size and the most exquisite shapes, more like a fancy *Pelargonium* in form and size than the ordinary run of Azaleas. They are also of good substance, and will be likely to prove invaluable for buttonhole and other bouquets. They will probably soon be exhibited, and, if I mistake not, certificated in London. Several crosses have also been effected between the Indian and *sinensis* sections, and Mr. Carmichael is sanguine of his ultimate success in originating a race of Indian Azaleas hardy enough to stand through the severities of our winter in the open air. *D. T. Fish*.

**Plants and the Frost.**—Now that the frost has apparently left us, at least for a time, its effect on shrubs and other descriptions of plants is becoming apparent, and, judging from the weather-beaten dejected look of many, it is to be feared that losses amongst them will be something considerable. The number of killed it is impossible to estimate just yet, as they are very deceptive, for it will be found that some of those which look green and all right at present will succumb and dry up when they get the drying winds coursing through their branches. As to the wounded and hard-hit, they are to be seen on all sides, and many, in their feeling of commiseration for these, set about amputating the frost-bitten limbs, which operation at this early period is a great mistake, as, half-naked though they be, the little foliage and twiggy shoots they have on are at least some protection against the blasts, which even in ordinary seasons are so trying to vegetation. This being the case, it will be seen how important it is that they be left intact at present, and the more so as one cannot see with any certainty where to cut; but later on, when the buds start, the living and dead portions may be detected at a glance, and the knife guided accordingly. The kinds of evergreens that have suffered most with us are *Euonymus* and *Laurustinus*, the former, although protected, being much cut about, and the latter, judging from their offensive odour, having fared but little better; which is not to be wondered at when we consider how sappy and full of growth they all were in the autumn. Strange to say, Sweet Bays

have stood the ordeal remarkably well, a plant 20 feet high that was killed down to the ground in 1860 being, so far as can be judged now, but little the worse. *Magnolia grandiflora* on a south wall is sadly browned, and *Garrya elliptica* has the points of the young shoots damaged, but *Rhododendron Falconeri* is quite untouched, thus showing conclusively how hardy it is. *Bambusa Metake* is still as green as a Leek, and from what I have seen of this highly ornamental plant, I believe it will endure any amount of frost; and *Chamaecyparis Fortunei* is sufficiently enduring to be trusted in any ordinary situation where it can get a little shelter from rough winds, as I find those we have that are so favoured are not affected in any way by the cold. I am hopeful that *Arca sapida* may be sufficiently hardy to stand our winters, and shall be glad to hear if any one has tried it, and with what success, or whether there are any other Palms that will bear 20° or 30° of frost without suffering, for if so they will be valuable acquisitions in all outdoor ferneries. Pampas-grasses where unprotected look sadly bleached, and I would advise those who have plants of these to leave them just as they are, without any trimming—the dead parts forming the best shield that can be provided for the crowns, which but for such friendly shelter will be left much exposed, at a time when they are the most tender. In the case of any deaths occurring among these highly ornamental plants, their replacement should be deferred till May, as at best they are ticklish things to move, and to do so before there is any growth in them, and now that they are so much injured, is only to court failure, for, being without life in the leaves, it is impossible for the roots to make any headway. Evergreens of all descriptions are also best left till near the same time, especially as the season is likely to be backward; but the thing with these is to catch them just as they are on the move, when if transplanted with care during a showery or dull time, success is certain. *J. S.*

**A Caution: Vines Killed by Frost.**—"Vines killed by frost! Where? Under what circumstances? Radically wrong management, that's certain!" I can imagine some such exclamations as the above may be indulged in when the heading of this letter catches the eye of the reader; and justifiably so, too—for at first sight it certainly does look like wanton neglect, or inability and inexperience on the part of the grower, under whose charge Vines are destroyed by frost; but if you will suffer it, I will try to explain to your readers how this misfortune happened to me, and if I cannot entirely extricate myself from blame or want of foresight, I may at least be able to show that the mishap which I have experienced might also have befallen the most able gardener similarly circumstanced. Last spring I had occasion to plant two vineries respectively with *Hamburgs* and *Muscats* in external borders, not because we prefer them outside, but, owing to circumstances which I need not here bring forward, it was considered unadvisable to plant inside. Early in April, at the time of planting, the Vines had burst their buds, and commenced to grow; they were very promising, being in a most satisfactory condition, and we were enthusiastically anticipating great results, having gone beyond ordinary trouble and expense to ensure success: yet we were doomed to disappointment, for all our care and coaxing would not entice them into an early free growth; no matter what we did, it was of no avail, for we were absolutely helpless, with the elements against us. A continuance of cold, wet, sunless weather unprecedented in my memory, kept the borders too cold to excite root-action, and until this was free it was simply useless to try to force by giving a high atmospheric temperature, as this would have made a bad case worse, by causing a weak attenuated growth, and speedily defeated the object in view, that of laying the foundation of fruitful permanent Vines. Day after day, and week after week, we looked for a favourable change in the weather, but remained ungratified, and it was June and July before the *Hamburgs* and *Muscats* respectively grew away satisfactorily, consequently they did not reach the tops of the rafters and fill the trellises with laterals until late in the season; nevertheless in November they were in every respect all that could be desired but for the unmaturing state of the wood. This was of course an irremediable and serious defect, the foliage of the *Hamburgs* had yellowed, but that of the *Muscats*, although the wood was nicely browned, was comparatively green and imperfectly finished. They were in this condition when the unexpected frost occurred, which suddenly defoliated them in various districts. No wonder it alarmed the gardeners, and caused comment in your columns, coming as it did so unusually early, immediately after a cold, moist summer—if summer it could be termed, with everything in the vegetable kingdom in such an unprepared state to meet it. How did the frost act on them? may be asked. I admit I am not a little mortified in having to own it killed the *Muscats*. The *Hamburgs* were par-

tially defoliated, but they are apparently little if at all injured; their roots are all safe, while those of the Muscats are dead. It is apparent in our case that the mischief was caused by the portions of stems exposed outside, where they passed through the wall, being frozen through, as in the case of those described in the *Gardeners' Chronicle*, in December, by Mr. Culverwell and others; and there is no question that had these been effectually protected the Vines would have been saved. I am also of opinion, that if the top growth had been restricted by confining it to half the length of the rafters, thereby discouraging late root-action and checking the flow of sap, the wood would have matured more perfectly, and consequently not have been so susceptible to the injurious effects of frost. But it is easier to see preventives, or imagine we see them, after mischief is done, than to foresee the nature of the weather and prevent its influence. I have experienced a humiliating and dearly bought lesson, which will not be readily forgotten; its publicity may be of service as a caution, but I fear our case is not exceptional, and it is in a great measure for those who may be unfortunately situated in like manner to myself that I have written, for although no one would wish for others to meet with like misfortunes to himself, yet there is a kind of consolation in knowing you are not alone. Fortunately I am favoured above many in having employers who can meet failures in a reasonable and practical light, and I would that all gardeners were so placed. If you think it likely to be interesting to any of your readers I will, at some future time, send a note describing the manner in which the Hamburgs behave after the partial defoliation. [Please do so. Eds.] C.

**Fir-tree Oil.**—Still another insecticide, which, if its qualities are at all like those enumerated in the pamphlet now being circulated, must cause it to be in great request, but, unfortunately, like quack medicines sent out to cure all diseases, these wonderful antidotes do not generally effect what the vendors claim for them, or mealy-bug, the scourge of plant-houses, would long ago have ceased to exist. Paraffin is the best remedy I have met with up to the present time in dealing with these pests, and it has the recommendation of being cheap, which, as there is in most gardens such frequent use for it, is a great consideration, especially where expenses are expected to be kept down to the lowest point possible consistent with cleanliness and good order. Insecticides are generally a very heavy item in garden accounts, and if they cannot be made and offered cheaper it would be a great boon if we could only get tobacco for fumigating purposes duty free, as the majority of the paper sold for the same purpose is mere rubbish, the smoke from it being more unpleasant to the unlucky individual who has to watch it being consumed than hurtful to the aphids. These only get a little stupefied under its influence, which soon wears off after a little fresh air is admitted, when the insects become as lively and troublesome as ever. It is not the manufactured tobacco that is wanted, but the common leaf, just as imported, which might in some way be made obnoxious to all fond of puffing the fumes from a pipe. J. S.

**The Time to Plant Tree Pæonies.**—On visiting Newton Court the other day my attention was specially called by the proprietor, J. H. Porteus Oakes, Esq., a keen horticulturist, to the state of many of the Tree Pæonies, of which there are a great many in his well well-furnished garden. These looked, and were, quite dead to the ground—the result, as he assured me, of spring planting. These plants should never be disturbed, unless in the autumn—immediately after the fall of the leaf being the best of all seasons for transplanting or dividing Tree Pæonies. It is surprising that these handsome flower are so seldom grown. As single plants in the centre of beds of herbaceous plants, or at the back of wide borders, or in groups in the fronts of shrubberies or on lawns, there are few plants so showy or so useful as these magnificent Pæonies. D. T. Fish.

**Heeling-in Broccoli.**—There has been much written from time to time against heeling-in Broccoli, but where this has not been done few will be found to have escaped the severity of the winter, as not only are the greater part of these killed, but even old Cabbage stumps and other of the hardy Brassicas are destroyed in like manner. Vegetables of this class must therefore be very scarce and dear for a long time to come. No doubt those in gardens have suffered more on the whole than those in fields, which partial immunity arises from two different causes, the one being that those in fields are at all times subjected to more air, and are consequently endowed with a harder constitution; and the other is the different system pursued by the market growers, who do not stir the soil so deeply before planting, and who also take more out of it, on which account the growth at no time is so quick and gross—which is a great gain, as the plants, instead of being soft and sappy when winter

sets in, have hard fibry stems that are in a measure proof against frost. Another point in their favour is that the plants are generally pricked out, instead of standing in the seed-beds to draw, which helps materially in inducing a dwarf sturdy habit—qualities that Broccoli in walled-in gardens seldom have unless similarly treated and cared for. The advantage of heeling-in Broccoli is, that when the snow and cold weather come, instead of the leaves dropping down with the weight or action, and leaving the hearts exposed, they enfold those vital parts and lie flat on the ground, where Nature's covering renders all safe from the action of cold. The heeling in, however, should take place earlier than is generally done, the end of August being the best time, as the roots then get fresh hold of the ground; and every one knows how much better prepared a plant is to battle with changes such as have to be encountered in winter, when the food supply is not entirely cut off. J. S.

**Rapid Rise of the Sap in Vines.**—At p. 341 "F. C." records what may be considered rather an unusual occurrence in the rise of sap in Vines. Something similar has happened here. When I took charge of this place on the 1st ult. the Vines in the late house (to which no fire-heat has been applied) appeared to be pushing away very nicely and by the 12th they were what may be termed well broken; on that date they suddenly commenced to bleed at the extremity of the rods, and so rapidly did the sap run that in a very short time the canes were wet right down to the stem; the greatest flow of sap coming from the strongest canes. I have no doubt the sudden change in the weather, with powerful sunshine occasionally acting on what is in all probability imperfectly ripened wood, is the cause of the bleeding. After four days' hard bleeding the flow of sap has stopped without any artificial help—a fact, in my opinion, which proves the weather's influence, seeing that it has again changed to bitter cold by day and sharp frost at night. This bleeding is very easily prevented by applying at pruning time a good dressing of Thomson's Styptic, a preventive I have never known to fail. W. Confort, Knowle Hall, Warwickshire.

**Dendrobium infundibulum.**—This Orchid is a most desirable one, on account of the durability of its lovely white flowers. I know of nothing short of the everlasting to rival it in this respect. If the blooms are picked as soon as they open, and kept in water (which should be renewed now and then), with a little charcoal added, they will retain their beauty over two months. W.

**Early Vegetables.**—Every one who has a garden essays to get early vegetables, and this season they will not have an imaginary value, as the great dearth of all kinds of edibles in that line will make them more acceptable than ever. None are prized more highly, perhaps, than new Potatoes, and it is surprising the shifts some put themselves to to produce these in the absence of frame accommodation, but if there happens to be a low wall or close fence of any description facing south, a temporary contrivance may be quickly improvised that will ensure the safety of the tops, and secure a crop at a modicum of cost and trouble. The simplest and cleanest way, if it can be effected, is to run a wide board or two along the front of the border, and support them in an upright position with stakes, and if from these some rods are run in a transverse manner, they will form a resting-place for mats, or anything else to be laid on as a covering. Reed or straw hurdles answer admirably for this, as they can be lifted on and off easily and quickly, and there is no fear of them being disturbed or displaced by wind as mats are apt to be. To get the Potatoes in as advanced a state as possible before putting them out, it is a good plan to start them in small pots or boxes of leaf soil; but if this is done they should not be subjected to much warmth, but stood somewhere under glass where they can have plenty of air. So favoured, their shoots will come sturdy and strong, and there will be little or no check in transferring them from one position to the other when planting takes place. To make the most of the room, the sets need not be more than 9 inches apart, and the rows will be far enough from each other at a foot, as the good old Ashleaf or Myatt's, which are the best for this kind of work, do not run to too much top. The space between will come in of great use to prick out and nurse on Cauliflower, Lettuce, and Celery, that have been sown some time since in boxes, as they can stand there and grow till they are large and strong enough for their final positions outdoors. In preparing such a border for the above-named uses, or to grow Kidney Beans, it is necessary to make it both light and rich, which may be done by working in plenty of leaf-mould, or the rakings and trimmings from shrubberies, the refuse from the potting-bench, or any rubbishy soil of that kind to hand for the purpose. A single row of Potatoes may be got very early by simply planting

tolerably close to a raised bank, a south wall, or boarded fence, where by night the tops can be protected by sticking in a few evergreen branches in front, and removing them again in the morning, as by their aid frost is warmed off and the Potatoes made snug against any change in the weather. J. S.

**WHAT TO PLANT.**—The planting season, though far advanced, is not yet at an end, for, according to the old adage, planting may safely be done in all months of the year that contain the letter *r*. This being so—or at least there is sufficient truth in it to make it of general acceptance—there is thus a full month before us to carry on the work to satisfaction. What should I plant for game covert, as plants safe against the ravages of ground game? What should I plant in severe sea exposures? What should I plant upon light sandy moorlands? What upon strong tenacious clay soil? What upon flow and peat soil, or peat moss, &c.? These are the kinds of questions put in some form almost daily, and although apparently very simple, are yet after all not so easily answered with certainty, for it is not one simple and single difficulty that has to be met and provided against, but, as the doctors have often said, there is a complication of diseases, and what would cure one aggravates another. With many trials and attempts, some successful, but many more failures, I give the following as the best and most reliable information and directions for the most general and important departments.

**GAME COVERT.**—1st. As to what species of plants to plant for game covert. These unfortunately are very limited in variety. There is only the Rhododendron in all its varieties, which may with all safety be relied upon as proof against both hares and rabbits. They never touch these, however much exposed, not even during intense frost or snowstorm. The common Box-wood, whether in the tree or dwarf form, is perfectly safe, and may be relied upon as game-proof however severely exposed. The Butcher's Broom, Spurge Laurel, and Juniper, are respectively suitable for game covert, and their leaves are so distasteful to ground game that they seldom interfere with them, and certainly never eat their leaves as food. In planting a group for game covert, to do without any protection, I would recommend as trees the *Abies Nordmanniana*, planted at 15 feet apart, or say 200 trees per acre, and the intermediate space filled up with a mixture of Rhododendrons and Box-wood to 5 or 6 feet apart. I find the *Abies Nordmanniana* quite distasteful to rabbits, so much so that during the whole winter of 1879 a considerable number of trees completely exposed to ground game escaped without injury, whereas every other plant near them, except Rhododendrons and Box-wood, were less or more destroyed.

**SEA-SIDE PLANTING.**—2d. What to plant in extreme sea exposures. In forming an outside belt on the exposed side of a plantation next the sea, I would plant a double row, in zigzag form, 4 to 5 feet apart, of Sea Buckthorn, and keep it low and bushy, or trimmed in hedge fashion. Next to this I would plant another row, but twice as wide as the former, consisting of Elder. This is such an accommodating plant that it can be made subservient to almost any purpose. It may be cut and kept low and bushy, or it may, as should be for this purpose, allowed to grow to a considerable height—indeed as high as possible—so as to shelter the next and succeeding rows, which should be Sycamore, either planted simply as a protection to the succeeding belt, or with the view of producing useful timber. As evergreens I would plant Silver Fir and Cupressus Lambertiana; they, in this district, which is probably as much exposed as any in Scotland, are decidedly the most vigorous and healthy. The Cupressus Lambertiana is not to be relied upon as a timber tree, but spreads and flourishes so well that it forms an admirable shelter to other trees, and endures the sea exposure better than any other evergreen except the common Silver Fir. With these fine species of plants there is no difficulty of forming an excellent shelter-belt in the most severe sea exposure, and if they do not succeed no others need be tried, at least so far as my experience goes.

ON LIGHT SOIL.—3d. Upon extremely light, thin, and poor ground—care being taken that it is rendered perfectly dry by drainage if required—I would plant common Beech, bushy, well-rooted, not too large plants, and amongst the Beech a mixture of Mountain Willow, Birch, and Aspen Poplar. Silver Firs may also be planted as a variety, and for the sake of winter appearance. If these do not succeed nothing probably will.

ON HEAVY SOIL.—4th. In planting strong heavy clay soils the great difficulty is to get the plants to start growth, and in order to do this it is often necessary to put in a spadeful of sandy loam to each plant. I would plant such ground with a mixture of common Oak and Silver Fir, allowing either to have the pre-eminence as is found desirable. Strong clay soil produces the very best quality of Oak, and the Silver Fir also flourishes upon it, and if closely grown so as to properly check the growth of the branches, it attains to valuable timber. *C. Y. Michie, Cullen House, Cullen, March 29.*

### Notices of Books.

#### The Botany of Central America and Mexico.

On more than one occasion we have alluded to Mr. W. B. Hemsley's labours in preparing an enumeration of the plants of Central America and Mexico for Messrs. Godman and Salvin's *Biologia Centrali-Americana*. At pp. 149—150 of vol. x. (new series) will be found some information respecting the scope and character of the work, and in vols. xi. and xii. we printed Mr. Hemsley's preliminary list of Orchids. The publication of the botany and zoology was simultaneously commenced last year, the first part of each subject having appeared in September. Three parts of the botany have already appeared. The work is in a quarto form and printed in bold type, being uniform in this and other respects with the zoology. It is questionable whether, considering the inevitable incompleteness of the botanical portion, the Editors have not too strictly adhered to uniformity, for they might have published the botany in a less expensive form, and it would have been equally useful. But on this point the Editors were fully entitled to exercise their own discretion, and botanists will not be disposed to grumble because the author has not critically elaborated the enormous amount of material lying in European herbaria. Indeed it is impossible that one person could within a reasonable period write a complete Flora of the vast area under consideration, and it was a wise resolve on the part of those concerned to keep the work within manageable limits, as there is all the greater probability of its being completed. As explained in the place quoted above, the primary object of the Editors was to collect together the material for a comparison of the laws governing the distribution of the plants and animals inhabiting the country. After the work had been some time in hand, an opportunity occurred of including an important collection formed by Drs. Parry and Palmer, which was almost exhaustive of a certain region. This somewhat extended the plan of the work, and besides adding a large number of new species, it resulted in a considerable amount of revision, especially in many of the larger genera characteristic of the flora. The plan and scope of the work is briefly this:—A complete enumeration of all the species in the Kew Herbarium, giving the localities, altitudes, collectors' names, numbers, and other useful information. The names found in the Herbarium are often adopted without verification, and apparently distinct unnamed specimens are cited for the sake of their localities. In addition, all published species, not represented in the Herbarium by named specimens, are given with references to their places of publication. At least it is intended to include all such species, but as they are scattered

through so many books it is not surprising that some have been overlooked. For example, we miss *Calandrinia micrantha*, Schlechtendal, *Hortus Halmensis*, p. 10, t. 5. Besides the Kew collections, those formed by the French Scientific Commission have also been consulted, and Mr. Hemsley has described a large number of new species; so that the work, although not a critically elaborated descriptive Flora, is something more than a skeleton or simple list. It brings together an immense amount of material for monographers, and in all probability it presents a tolerably accurate view of the composition of the vegetation, susceptible to modification only as regards the number of species.

Horticulturists as well as botanists will recognise the liberality of the Editors, inasmuch as Mexico and Central America contain a vast number of ornamental plants not yet introduced into, or no longer existing in, our gardens. When we mention that the country included stretches through 24 degrees of latitude, and rises in some places to an altitude of nearly 17,000 feet above the level of the sea, some idea may be formed of the extent and variety of the flora, especially when we add that many districts are exceedingly rich in forms. The natural orders, Cactaceæ, Orchidæ, Compositæ, and Leguminosæ; and the genera, *Agave*, *Bouvardia*, *Cuphea*, *Dalea*, *Echeveria*, *Fuchsia*, &c., abound in forms. The three parts published carry the work from the Ranunculaceæ, as far as the genus *Desmodium* in Leguminosæ, and consist of 280 pages of letterpress and fifteen plates. Of the latter we shall have more to say anon. Exclusive of the Leguminosæ, forty-five natural orders are represented, and altogether there are 354 genera, comprising upwards of 2000 species, or about one-sixth of the estimated number of flowering plants and Ferns inhabiting Central America and Mexico. Up to the Leguminosæ there are about 1600 species, and the author thinks that a careful elaboration of the material would probably reduce the number by about 200; but on the other hand, judging from recent investigations, further exploration of the countries would result in the discovery of many new species. The reductions would be by no means equal in different orders, inasmuch as some have been recently monographed, whilst the species of some others are in a state of great uncertainty and confusion. With regard to undetermined species, we may assume that they will be much less numerous in succeeding parts of the botany, for the reason just adduced. Thus, among the Polypetaleæ, the Mimoseæ and the genus *Cassia* have been recently monographed by Mr. Bentham, the Melastomaceæ by Dr. Triana, the Passifloreæ by Dr. Masters, the Cucurbitaceæ by M. Cogniaux; and the orders below, generally speaking, are in a more manageable state for purposes of compilation. Therefore we may conclude, from the plan adopted, that the early parts of Mr. Hemsley's work will constitute its weakest point.

Now, with regard to what the book contains. In the first place we note that all the natural orders preceding the Leguminosæ, with the exception of twelve, half of which are small and unimportant ones, are represented in the flora. Of these exceptional orders, Canellaceæ, Sarraceniaceæ, and Calycanthaceæ occur in the immediately surrounding countries, and may possibly yet be discovered within the limits of the work. A representative of the Elatinæ has been received since the publication of part i., and it is quite likely that the Chaillatiaceæ are not wholly absent from Central America. This leaves only the Pittosporæ, Tremandraceæ, Dipterocarpeæ, Chlenaceæ, Humiriaceæ, Stackhousiæ, and Moringiæ. Of the new species described, we observe that a large proportion are inconspicuous, though none the less interesting, plants from the temperate and subtropical regions; few of them are really showy plants. This is what one would have expected, considering the large number of collectors who have visited the country. Nevertheless, there are hundreds of showy plants not yet introduced into cultivation.

A word respecting the plates, and we must conclude. They are by Fitch, and add greatly to the embellishment of the work. A few, we are informed in the prospectus, will be coloured from Mrs. Salvin's drawings, executed on the spot, but only one (*Cochlospermum hibiscoides*) has yet appeared. Of the more interesting figures we note *Thelypodium petiolatum*, a distinct Crucifer; two species of *Cordia*, an obscure genus of Caryophyllaceæ, *Margravia nepenthoides*, *Pelliciera Rhizophoræ*, a remarkable Mangrove; two species of *Ayenia*, a most singular Buettneriaceous

genus; and *Dalea insignis*, so distinct from all other species of this large genus (which numbers about 100 species in this flora) that one would take it to belong to a different genus.

### Variorum.

**EUCALYPTUS ROSTRATA.**—This species, our famous "Red Gum-tree," is perhaps the most important of the whole genus; although surpassed in celerity of growth by *E. globulus*, it is of higher value for the extraordinary durability of its timber, having in this respect perhaps a rival only in *E. marginata* of South-west Australia, but excelling that celebrated tree in increased rapidity of growth and in the greater ease with which it can be reared even in grounds with stagnant humidity. It never becomes so tall as the surpassingly gigantic states of *E. amygdalina*, *E. diversicolor*, or *E. obliqua*; but often attains a height of over 100 feet, and is said to have reached, under particularly favourable circumstances, even more than double that height—250 feet, according to Mr. Falck. The stem is proportionately stout, yielding a great bulk of timber, a diameter of 14 feet being on record. The bark is smooth, ashy-grey, or whitish, or occasionally in part slightly brownish, from early decoration of its darker outer layers, unless it should remain persistently rough on the base of the stem, or should in trees growing exceptionally on dry ridges be more persistent and less smooth. The tree will live even in permanent shallow swamps. As this tree, on account of its incomparably valuable timber, will be made the subject of many cultural efforts and experimental tests here and abroad, many additional observations concerning this species will probably be instituted for many years to come, which may in time also be collected in supplementary pages for these *Eucalyptus* decades. Even in California, where the indigenous forests supply the most magnificent timber Pines of the globe, it is found far more advantageous to rear *Eucalyptus* wood for fuel and for many other purposes for which it is adapted, than to grow Fir wood. *E. rostrata* carries with it the recommendation of being one of the best of its congeners to resist wet tropical heat. Thus in Mauritius it grew 50 feet in sixteen years. The vernacular name of "Red Gum-tree" is derived from the dark reddish-brown colour of the wood, the specific appellation from the beak-like pointed lid of the calyx. . . . *E. rostrata* supplies our well known Red Gum timber, which is so highly prized for its unsurpassed durability, especially underground; it is very dense, and in its grain flexuous but comparatively short, bearing an enormous downward pressure, and is but slightly subject to longitudinal shrinking; it remains for very long periods indestructible in fresh or salt water, or in wet ground. Its principal uses are for railway-sleepers, telegraph poles, fence and other posts, piles, bridge-planks, culverts, wheelwright's work (especially felloes), engine-buffers; shipbuilders employ it extensively for main-stem, stern-post, inner post, dead-wood, floor-timbers, futtocks, transoms, knighthead, hawse-pieces, cant, stem, quarter, and fashion timber, bottom-planks, breasthooks and riders, windlass, bowrails, &c. It should be steamed before it is worked for curving. Next to the Jarrah from West Australia it is best suited to resist the attacks of the Teredo and Chelura, and Termites. It takes a good polish, and may thus be used for furniture, though it is rather heavy and difficult to work on account of its great hardness. The specific gravity of Red Gum wood ranges from 0.858 to 1.005, or from 53½ to 62½ lb. per cubic foot. Mr. F. Campbell found the tensile strength to be equal to a pressure of 14,000 to 21,500 lb. per square inch. A ton of dry wood has yielded as much as 4 lb. of pearlsh or 2½ lb. of pure potash. *From Baron von Mueller's "Eucalyptographia."*

**GIANT GUM TREES.**—The ranges are covered with a dense forest of Gum trees, in many places of enormous height, standing with their smooth trunks close together and running up often for a height of 200 feet without giving off a branch. The light coloured stems are hung with rugged strips of separated bark. The great slenderness of the trunks of these giant Gum trees in proportion to their height is striking, and in this respect they contrast most favourably with the Californian big trees, which in the shape of their trunks remind one of a Carrot upside down, so disproportionately broad are they at their bases. The large species of Gum tree, the tallest tree in the world, is *Eucalyptus amygdalina*. As Baron von Müller says, "the largest specimen might overshadow the pyramid of Cheops." *Notes of a Naturalist on the "Challenger."*

**MALACHRA FIBRE.**—In the Paris Exhibition was shown a sample of a fibre named *Malachra rotundifolia* sent from Bombay. The plant is, however, only found in South America—at least so says Dr. King, to whom the supposed *Malachra rotundifolia* was sent for identification, and he states that it

is *Malachra capitata*, not *Malachra rotundifolia*. As a fibre, be it what it may, it undoubtedly deserves attention, for it is said to be quite equal to Jute. The following is the description given of it:—"The fibre is in length from 8 feet to 9 feet, has a silvery appearance, with a peculiar lustre, and is almost as soft as silk. In passing the fibre through the machinery damped with oil and water, as is commonly done with Bengal and Koukan Jute, yarn was produced strong enough and nearly equal to that made from the second quality of Bengal Jute. If the plant were carefully grown and well looked after, the fibre would no doubt rank fully equal to Bengal and Bombay Jute. Owing to the high prices ruling for Jute in Bengal and elsewhere, the new fibre, if carefully prepared, would command a ready sale at 3.12 rupees to 4 rupees per Indian maund." There appears to be no difficulty in growing this plant, which belongs to the natural order of Malvaceæ, in Bengal, marshy places within the tropics being considered favourable to its growth; and there is, therefore, every reason why a fair trial should be made of its apparently valuable properties. The fibre is prepared in precisely the same way as Jute, but requires to be steeped directly it is cut, as exposure to the sun dries and hardens the stems, preventing the easy removal of the bark from them, and rendering the fibre itself coarser in quality than it would otherwise be. *Times*.

**BEE KEEPING IN IRELAND.**—A Dublin correspondent writes:—"The visit of the Irish deputation to the Royal Agricultural show at Kilburn last year has already in various indirect ways been productive of substantial good, and it is interesting to note at least one beneficial result which may, if turned to practical account, prove of considerable advantage to the Irish agriculturist. There is an organisation known (unpretending to a degree) as the British Beekeeper's Association. This Association has been eminently and deservedly successful in its efforts to encourage a taste for bee culture and honey cultivation in England. They are about to send their travelling tent over to this country, in order to disseminate a more perfect knowledge of this useful art amongst the people than they at present possess. The first appearance of their 'tent' here will be at the Belfast Horticultural show in September next. It will be accompanied by a competent staff of operatives and exponents, and can scarcely fail to concentrate a large amount of public interest. The distinguished President of the Beekeepers' Association (the Baroness Burdett Coutts), at a recent meeting of that body, volunteered a statement regarding the proposed visit of the 'tent' to this country, in which that lady was very sanguine as to the results of the introduction of this comparatively new means of obtaining wealth and pleasure into this country. And further, by means of communications with Colonel King-Harman and Canon Bagot, she has taken prompt and practical steps for imparting reality to the project."

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, MARCH 31, 1880.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				Hygrometric Deductions from Glaisher's Tables 6th Edition.	WIND.	RAINFALL.

March 25.—A very fine cloudless day. Cold in early morning; warm about mid-day.  
 — 26.—A very fine bright day. Sky clear. Mild, but cool east wind. Cold at night.  
 — 27.—Generally fine but cloudy. Cold east wind. Overcast at night.  
 — 28.—A fine day; bright at times, but rather dull and cold. Little fog at night.  
 — 29.—A fine day, but rather cloudy and gloomy. Fog in morning. Cloudless at night.

March 30.—A fine day, partially cloudy. Milder. Cloudless at night.  
 — 31.—Fine in morning, dull after. Strong wind. Rain fell frequently after 1 P.M.

**LONDON: Barometer.**—During the week ending Saturday, March 27, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.32 inches at the beginning of the week to 30.29 inches by the afternoon of the 21st; increased to 30.36 inches by the morning of the 22d; decreased to 30.32 inches by the afternoon of the same day; increased to 30.36 inches by the morning of the 23d; decreased to 30.08 inches by the afternoon of the 25th; and increased to 30.24 inches by the end of the week. The mean reading for the week at sea level was 30.22 inches, being 0.03 inch below that of the preceding week, and 0.26 inch above the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 66° on the 26th and 64½° on the 25th, to 44½° on the 22d; the mean value for the week was 54½°. The lowest temperatures of the air observed by night varied from 27° on the 24th and 30° on the 23d, to 38½° on the 26th; the mean value for the week was 32½°. The mean daily range of temperature in the week was 22°; the greatest range in the day was 32½°, on the 25th, and the least 12½°, on the 22d.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—21st, 41°·7, — 0°·1; 22d, 37°·8, — 4°·1; 23d, 38°·6, — 3°·4; 24th, 42°, — 0°·1; 25th, 47°, + 4°·7; 26th, 49°·2, + 6°·7; 27th, 39°, — 3°·7. The mean temperature of the air for the week was 42°·2, being the same as the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 130° on the 24th, 127° on the 25th, and 117½° on the 21st; on the 22d the reading did not rise above 55°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 24½° on the 24th, and 26° on the 23d; the mean of the seven lowest readings was 28½°.

**Wind.**—The direction of the wind was E., and its strength strong and biting. The weather during the week was fine, bright, and very dry.

No rain fell.

**ENGLAND: Temperature.**—During the week ending Saturday, March 27, the highest temperatures of the air observed by day were above 63° at Bristol, Blackheath, Cambridge, and below 49° at both Sheffield and Hull; the mean value from all stations was 56½°. The lowest temperatures of the air observed by night were below 28° at Blackheath, Bristol, Cambridge, Wolverhampton, Nottingham, and Hull, and above 34° at Plymouth, Norwich and Sunderland; the mean value from all places was 30½°. The extreme range of temperature in the week was above 36° at Bristol, Blackheath, and Cambridge, and below 17° at Sheffield and Sunderland; the mean range from all stations was 26½°.

The mean of the seven high day temperatures was above 53½° at Bristol, Blackheath, Leicester, and Cambridge, and below 46° at Sheffield and Sunderland; the general mean from all places was 50½°. The mean of the seven low night temperatures was below 33° at Bristol, Blackheath, Leicester, Cambridge, and Wolverhampton, and above 39½° at Truro and Plymouth; the mean value from all stations was 34½°. The mean daily range of temperature in the week was above 22° at Bristol, Blackheath, and Cambridge, and below 10° at Sheffield and Sunderland. The mean daily range from all places was 15½°.

The mean temperature of the air for the week from all stations was 41°, being 6½° higher than the value for the corresponding week in 1879. The mean temperature of the air was above 44½° at Truro and Plymouth, and below 39° at both Sheffield and Hull.

**Rain.**—Very little rain was measured, except in Devon and Cornwall. At Truro 1.03 inch was measured, and at Plymouth 0.43 inch fell; at almost every other part of the country no rain fell.

The weather during the week was fine, bright, and dry, with cold east winds.

**SCOTLAND: Temperature.**—During the week ending Saturday, March 27, the highest temperatures of the air observed by day varied from 51½° at Glasgow to 47° at Dundee, Leith, and Perth; the mean value from all places was 49½°. The lowest temperatures of the air observed by night varied from 28° at both Paisley and Leith, and 28½° at Edinburgh, to 35° at Aberdeen; the mean value from all stations was 30½°. The mean range of temperature from all places was 18½°.

The mean temperature of the air for the week from all stations was 39½°, being 5° higher than the value for the corresponding week in 1879. The mean temperature was the highest at Aberdeen and

Glasgow, both 40½°, and the lowest at Leith and Perth, both 38½°.

**Rain.**—The weather during the week was fine and dry, and no rain was recorded to have fallen.

JAMES GLAISHER, F.R.S.

## Obituary.

NUMEROUS friends will regret to hear of the death of Mr. THOMAS MAUDE, on March 24, at the Gardens, Tong Hall, near Leeds, where he had resided and acted as gardener to the present and late Colonel Tempest for the long period of fifty-two years.

## Answers to Correspondents.

**AARON'S ROD: H. E.** The question is, What is the plant called Aaron's Rod?—not the Golden Rod; we know all about that.

**BOILER: C. Z.** An ordinary horticultural builder should be able to give you the information desired better than Mr. Baines, who is not in the trade. Such firms as the Thames Bank Iron Company supply piping, and the cost of the same depends upon the price of iron at the time of purchasing. The cost of making such boilers, and also of the brickwork, will depend entirely upon the cost of labour in the locality in which the work is done.

**CARPET-BEDDING: Cannon & Reid.** We do not know of any scarlet or yellow-flowered plants that would answer your customer's purpose. If he will be satisfied with coloured foliage only, we would recommend one of the brightest of the *Alternantheras*, and *Mesembryanthemum cordifolium variegatum*.

**CLOVERS: Cannon & Reid.** We know of nothing more trustworthy, or so readily obtainable, as the articles in Morton's *Encyclopedia of Agriculture*.

**CINERARIAS: F. & A. Smith.** The selection of blooms comprises many richly coloured varieties of refined quality, not over large in size perhaps, but having the telling property of the dark disk surrounded by a ring of pure white. The maroon and puce crimsons passing off to magenta next the white, are very rich looking. We are glad also to see some of the blue-purple amongst them, these being very telling for decorative purposes, and having been somewhat neglected of late.

**DISEASED LIME TREES: W. G. C. & S.** The Lime twigs seem affected in the same way as Apple twigs from canker, but whether from the same cause or not it is difficult to say. It is possible that some fungus may be involved in the matter. Cut off some of the larger shoots and put them in a shady spot, and perhaps the fungus may be developed in the autumn. I will treat the specimens you have sent in this way, *M. 7. B.*

**DYEING FERNS: H. H.** It is a very unnatural process, and the colours are seldom such as would be seen on the living plant. We suppose Judson's dyes would answer the purpose.

**GRAFTING CAMELLIAS: H. H.** The process is the usual one, but should be carried out in a close, warm house, till the union is perfect. The stock may be in active growth, but the grafts themselves should not have started.

**INSECTS: H. C.** We fear the breaks of your *Catleya* have been gnawed off either by the weevil (*Otiorynchus*), or the hothouse cockroach (*Blatta*). The small flies found in one of the breaks belong to the parasite family *Chalcididae*, and were described in the *Gardeners' Chronicle*, 1869, p. 1230, under the name of *Isonoma Orchidearum*. We believe they must have fed in the larva state on the larva of some beetle or other insect which had burrowed into the break; but it seems to be now clearly proved that some of these *Chalcididae* feed on vegetable matter, in which case their destruction would be advisable; whether, however, these *Isonoma* are amongst these phytophagous insects remains to be determined by those who have large collections of Orchids, and time for the investigation. *I. O. W.*

**LUCULIA GRATISSIMA: Subscriber.** If you have a greenhouse or an intermediate-house the best thing you can do is to plant it out in some good sandy loam, taking care that it has a good range of root space.

**NAMES OF PLANTS: George Wall.** 1, *Helleborus orientalis*; 2, *Scilla biflora*; 3, *Erica carnea*; 4, *Asarum europæum*. Is this last wild?—*R. F.* We cannot name the plant from the scrap sent. It is probably an Aster, or some nearly allied plant.—*M. M.* *Andromeda floribunda*.—*F. Freeman.* *Ruscus aculeatus*.—*C. W. Dod.* *Scilla biflora*, var. *alba*.—*T. Beauchamp.* The green-leaved plant is *Asarum europæum*—a by no means common British plant, though perhaps not of much commercial value. The Moss you send under the name of Stag's-horn is *Lycopodium clavatum*. The other moss is *Leucobryum glaucum*.—*R. Masters.* We do not recognise the plant. Could you not try to flower it under glass?—*W. P. D.* *Weston-super-Mare.* *Griselinia littoralis*. Hardy to the extent that in favourable situations it will stand ordinary winters.—*J. Simonds.* 1, *Linum trigynum*; 2, *Pentas carnea*; 3, *Lygodium japonicum*; 4, *Saliginella apus*; 5, *Campylosorus rhizophyllus*; 6, *Cyperus alternifolius*.—*C. R.* 1, *Polystichum angu-*

lare; 2, Cyanotis vittata, also known as Tradescantia zebrina; 3, not recognisable.

PHLOXES AND PÆONIES: H. W. Twelve good Phloxes of the P. decussata, or late-flowering type, are—Coccinea J. K. Lord, La Candeur, Lothair, Lucien Tisserand, Madame la Comtesse de Turenne, Madame Moisset, Mons. Doronau, Mrs. Laing, Richard Wallace, Roi des Roses, and the Queen. Twelve good varieties of Pæonies:—Alice de Julivecourt, Belle Douaisienne, Rossuet, Charles Binder, Duchesse de Theba, Eugène Verdier, Leonie, Madame Chaumy, Monsieur de Villeneuve, Prince de Salm-Dyck, Reine des Roses, and Souvenir de l'Exposition Universelle.

PLANTS: T. F. Webb. We know nothing of the book you allude to. Perhaps the book of Garden Plans published at the Journal of Horticulture office, 171, Fleet Street, would meet your requirements.

PLANTS FIGURED: W. H. O. The plants you name will no doubt soon be in the Catalogues. Such things require some time to get up stock.

RHODODENDRONS: E. Perkins. A slightly spotted white arboreum, handsome, as most of the kinds are, but not so effective as the forms with richer spotting, or the species with larger flowers. It is, of course, a tender kind.

SEAKALE: Mrs. C. B. The rotting of the roots after sprouting is probably owing to their immature state, owing to the late wet ungenial season, or to a deficiency of drainage, or both.

SEEDS: J. Steele. 1 and 2, seeds of different species of Eucalyptus, but whether of the species you name we cannot tell; 3, seeds of an Acacia—perhaps of the Black Wattle (Acacia decurrens), or A. mollissima.

SULPHATE OF AMMONIA: Amateur. Sulphate of ammonia in a liquid form is a very valuable plant fertiliser, but requires great care in its use. It should never be made strong, and be given in the evening, instead of in the morning or daytime when the sun shines.

VERBENA: James King. The Verbena of a straggling habit, with pink flowers, and deliciously scented, which was common twenty or thirty years ago, is no doubt V. teucrioides, one of the parents of the fine show flower now in existence.

ZONAL PELARGONIUMS: W. A. For a scarlet with white eye take A. F. Barron, or Col. Seelye; for salmon with white eye, Fanny Catlin, or Nancy Lee; for a salmon bedder, Truth; for a rose, Jules Grey. These are all good, but tastes may vary as to preferring them before others.

CATALOGUES RECEIVED:—Charles Turner (Slough), General Spring Catalogue of Plants.—Simon-Louis Frères (Metz), Catalogue of Plants.—V. Lemoine (Nancy), General Catalogue of Plants.—A. Lietze (Rua Ovidor 47, Rio de Janeiro, Brazil), Price List of Seeds, Plants, and Tubers.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

COMMUNICATIONS RECEIVED:—J. B.—T. McK.—J. O. W.—M. J. B.—J. T. E.—H. M.—A. S.—C. W. S.—E. B.—R. P.—R. B. (many thanks).—A. W.—E. C.—W. G. S.—W. B. G.—C. F. F.—W. B.—J. McP.—J. C. & Co.—F. Wright.—J. Stewart.—W. S. (thanks).—W. D.—T. E.—Q. R.

Markets.

COVENT GARDEN, April 1.

There is no improvement in trade, and prices remain steady at last week's quotations, with the exception of Champion Potatos, on which there is an advance of 10s. per ton. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—WHOLESALE PRICES.

Table with 2 columns of plant names and prices. Includes Arum Lilies, Azaleas, Begonias, Bouvardias, Cinerarias, Cyclamens, Cyperus, Dielytra, Dracena terminalis, Erica gracilis, Euonymus, and Ferns.

CUT FLOWERS.—WHOLESALE PRICES.

Table with 2 columns of flower names and prices. Includes Abutilon, Arum Lilies, Azalea, Bouvardias, Camellias, Carnations, Cyclamen, Epiphyllum, Fuchias, Euphorbia, Gardenias, Heliotropes, Hyacinths, Lily of Val, and Mignonette.

FRUIT.

Table of fruit prices including Apples, Oranges, Pears, Peas-apples, Strawberries, Lemons, and Onions.

VEGETABLES.

Table of vegetable prices including Artichokes, Asparagus, Cabbages, Carrots, Cauliflowers, Celery, Chihis, Cucumbers, Endive, Garlic, Potatoes, Herbs, Horse Radish, Lettuce, Mint, Mushrooms, Parsley, Peas, Potatos (new), Rhubarb, Seakale, Shallots, Spinach, Tomatos, and Turnips.

SEEDS.

LONDON, March 31.—A daily increasing demand is now experienced for farm seeds. The very low rates which with scarcely an exception prevail this season in London for all the leading varieties, prove a source of satisfaction to the agricultural community, and will enable farmers to seed their land at a much less expense than usual. Canadian Clover seed, in particular, being this year exceptionally handsome and unprecedentedly cheap, meets naturally with growing favour. English Cow-grass is also now very reasonable. Superfine white is scarce, and comparatively dear. Trefoils are unchanged. Alsike keeps remarkably low in price. Italian Rye-grass is likewise exceedingly moderate. Sanfon being in strong request and very scarce shows a further advance of 2s. per quarter. There is more inquiry for Timothy and Lucerne. Tares continue firm: of good clean ones there are not many here. Brunswick Gore Vetches sell at 49s. per quarter; Hemp seed 31s. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Monday being a statute holiday no business was transacted at Mark Lane. On Wednesday the trade in Wheat was decidedly quiet, with a slight tendency towards rather lower prices. Not much business, however, was in progress. Choice barley was firm, but for other kinds the trade was slow. Oats were firm at full quotations, the recent improvement being supported. Beans and Peas were steady, but the flour trade was quiet. Average prices of corn for the week ending March 27:—Wheat, 47s. 3d.; Barley, 34s. 5d.; Oats, 22s. 10d. For the corresponding period last year:—Wheat, 40s. 8d.; Barley, 33s.; Oats, 20s. 8d.

CATTLE.

At Copenhagen Fields on Monday trade in beasts was not brisk, but prices were quite as good as of late, with a fair clearance. The supply of sheep exceeded the demand. Prices were lower, and several lots unsold. There was a reduction in the price of lambs, although the supply was short. Calves were rather lower.—Quotations:—Beasts, 4s. 4d. to 5s. 2d., and 5s. 6d. to 6s.; calves, 5s. 6d. to 7s.; sheep, 5s. 2d. to 5s. 6d., and 5s. 10d. to 6s. 4d.; lambs, 8s. to 9s. per 8 lb.—On Thursday the cattle trade was dull in tone. Supplies were short, but equal to the demand. Beasts sold slowly at about the above rates; sheep dull and drooping, lambs decidedly easier, but calves steady.

POTATOS.

The Easter holidays interfered, as usual, with business, but prices have not varied much from those last reported, except in the case of Champions, which have improved.—The imports into London last week were extensive, comprising 157,536 bags from Hamburg, 15,008 Bremen, 6586 Danzig, 5928 Harburgh, 2970 Rotterdam, 1464 Harlingen, and 23,865 sacks from Stettin.

HAY.

From Thursday's Whitechapel Market report we learn that with a good supply of hay and straw on sale the trade was very dull for inferior kinds. Quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 40s. to 75s.; superior Clover, 120s. to 132s.; inferior, 80s. to 100s.; and straw, 36s. to 40s. per load.

COALS.

The prices current at market during the week were as follows:—Beaside West Hartley, 13s. 9d.; East Wylam, 15s.; West Hartley, 13s. 9d.; Walls End—Hetton, 14s. 6d.; Hetton Lyons, 13s.; Hawthorn, 13s. 3d.; Lambton, 14s.; Wear, 13s.; South Hetton, 14s. 6d.; Tunstall, 13s.; Vane's, 13s.; Chilton Tees, 14s.; Tees, 14s. 3d.; Radford Navigation, 15s. 9d.

Government Stock.—The closing price of Consols on Tuesday was, for delivery, 98 to 98½, and for the account, 98½ to 98¾. On Wednesday the figures were 98½ to 98¾ for both delivery and the account. The final quotations on Thursday were, for delivery, 98½, and for the account 98½ to 98¾.

New Crimson-Scarlet Fringed Primula. F AND A. SMITH can supply the above (the same colour as exhibited by the Royal Horticultural Society at South Kensington) in 2s. 6d. and 5s. packets. Also their well-known strains of other sorts of PRIMULA, CINERARIA, and CALCEOLARIA, &c. LIST on application. The Nurseries, West Dulwich, S.E.

To the Trade EXTRA CHOICE MIXED FRINGED PRIMULA, from a splendid strain. E. WILSON SERPELL, 21, Cornwall Street, Plymouth, begs to offer the above to the Trade at 30s. per ¼ ounce, or roots per ounce. Retail packets 1s. and 2s. each post-free.

TO THE TRADE ONLY. SPECIAL OFFER of YOUNG CONIFERÆ.

CONIFERÆ, half a foot high. 12s. per 100, 17 of each of the following six sorts. £5 per 1000, 170 of each of the following six sorts. CUPRESSUS Lawsoniana argentea compacta RETINOSPORA filifera RETINOSPORA pisifera squarrosa (Veitch) THUJOPSIS dolabrata CONIFERÆ, one foot high. 25s. per 100, 17 of each of the following six sorts. £6 10s. per 1000, 170 of each of the following six sorts. CUPRESSUS Lawsoniana argentea glauca RETINOSPORA filifera RETINOSPORA pisifera aurea squarrosa (Veitch) THUJA Vervaeana

A. M. C. JONGKINDT CONINCK, TOTTENHAM NURSERIES, Dedemsvaart, near Zwolle, Netherlands.

GARDEN REQUISITES.

COCOA-NUT FIBRE REFUSE, 3d. per bushel; 100 for 20s.; truck (loose, 250 bushels), 30s.; 4-bushel bags, 4d. each. LIGHT BROWN FIBROUS PEAT, 5s. 6d. per sack; 5 sacks, 25s.; 12 for 45s., or 36s. per ton. BLACK FIBROUS PEAT, 5s. per sack, 5 sacks 22s.; 12 for 40s., or 34s. per ton; sacks, 4d. each. COARSE SILVER SAND, 1s. 9d. per bushel; 15s. half ton, 26s. per ton; in 1 cwt. bags, 4d. each. YELLOW FIBROUS LOAM, PEAT MOULD, and LEAF MOULD, 1s. per bushel. SPHAGNUM MOSS, 8s. 6d. per sack. Manures, Garden Sticks, Virgin Cork, Tobacco Cloth and Paper, Russia Mats, &c. Write for Free PRICE LIST. H. G. SMYTH, 10, Castle Street, Endell Street, Long Acre, London, W.C.

COCOA-NUT FIBRE REFUSE.—Useful at all seasons. Largest makers in the Kingdom. 1s. per bag, 30 bags £1 (bags included), truck 25s. free to rail; 5s. van-load, at Works, Janet Street, Millwall, E. P.O.O. payable at General Post Office, London. Orders to be addressed to A. FOULON, Fibre Merchant, 32, St. Mary Axe, London, E.C.

COCOA-NUT FIBRE REFUSE at Reduced Prices, as supplied to Messrs. J. Carter & Co., High Holborn, W.C.; at the International Agricultural Exhibition, Kilburn; and all the Principal Nurserymen and Seed-men in England. In 4 bushel bags at 1s., bags included; 30 bags, bags included, 20s.; or truckload of about 250 bushels, 25s. (truckload free on to rail)—J. STEVENS AND CO., Greyhound Yard, and 134, High Street, Battersea, S.W.

COCOA-NUT FIBRE REFUSE, as supplied to the Royal Horticultural Society.—Four-bushel bag (bag included), 1s.; 30 bags (bags included), 20s.; truck free to rail, 25s. T. RICH (late Finlayson & Hector), Cocoa-Nut Fibre Works, 24 and 25, Redman's Row, Mile End Road, London, E.

COCOA-NUT FIBRE REFUSE.—INVALIDABLE FOR FORCING, PLUNGING, FERNERIES, &c. 4-bushel bag, 1s., bag included; 30 bags, bags included, 21s.; truck, free to rail, about 250 bushels, 25s.; cartload at Works, 6s. Prompt cash. Post-office Order payable at Greenwich. CHUBB, ROUND AND CO., Fibre Works, Westlerry Road, Millwall, E.

**Hurry's Daisy and Weed Extractor,**

FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little Invention.

The following particulars, from the *Gardeners' Chronicle* of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of Mr. **ALFRED F. O'C. HURRY**, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: **THOMAS TILLEY**, 12, Walbrook, London, E.C. Cambridge Agents: **G. BEALES & CO.**;

Or Carriage Free of the Inventor on receipt of P.O.O. for 4s. 3d. and 5s. 3d., payable at Cambridge or Sawston.

Samples on application.

**SHAW'S TIFFANY.**  
**SHAW'S ELASTIC NETTING.**

The above articles, after twenty years' test, have been proved  
to be the best, cheapest, and most durable materials ever intro-  
duced for protecting plants and fruit-trees from spring frosts,  
and shading Hothouses in summer. The Advertisers, being  
the Inventors and Sole Manufacturers, caution the public  
against spurious Imitations, and to see that each piece bears  
the Makers' stamp, without which none is genuine.

**JOINT PIPES, or COILS,** on application.

**JONES'S PATENT "DOUBLE L"**  
**SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle  
Boiler, with the following improvements—viz., the water-space  
at back and over top of saddle increase the heating surface to  
such an extent that a "PATENT DOUBLE L SADDLE  
BOILER" will do about twice the amount of work with the same  
quantity of fuel; the cost of setting is also considerably reduced,  
and likewise the space occupied; at the same time these Boilers  
are simple in construction, and being made of wrought-iron are  
not liable to crack. They are made of the following sizes:—

Sizes.			To heat of	Price.
High.	Wide.	Long.	4-in. Pipe.	
20 in.	18 in.	18 in.	300	£ 7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From **Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W.,**  
May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial  
at my Nurseries, I beg to say that they are most satisfactory.  
I consider them the best in use, and without doubt the most  
economical of all boilers: they will burn the refuse of other  
tubular boilers I have in work."

**PRICE LISTS of HOT-WATER PIPES and CONNec-**  
**TIONS,** with Boilers, of all sizes and shapes; or **ESTIMATES**

Two Gold Medals awarded to us by the Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions.

Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

**KINAHAN'S LL WHISKY.**  
**KINAHAN'S LL WHISKY.**  
Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.**  
Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
Gold Medal, Paris Exhibition, 1875; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*  
**JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s 6d., 4s 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
More Remarkable Cures of Asthmatic and Consumptive Coughs and Throat and Chest Diseases by  
**DR. LOCOCK'S PULMONIC WAFERS.**  
—Mr. JOHNSON, M.P.S., 101, Meanwood Road, Leeds, writes:—"I recommend the Wafers in cases of Asthmatic and Consumptive Coughs, with the most beneficial results, and I also consider them the best medicine for all Throat and Chest Diseases." They give instant relief and taste pleasantly. Price 1s. 1/2d. and 2s. 9d. per box.

**HOLLOWAY'S PILLS.**—Pure Blood.—As this vital fluid, when in a healthy state, sustains and renovates every part of the living system, so when it becomes impoverished or impure it exerts a precisely contrary effect. It is abundantly manifest that any medicine which does not reach the circulation can never exterminate the disease; but any preparation capable of exercising a sanitary influence over the blood must with it be carried to every living fibre of the frame. The lungs, heart, liver, kidneys, and skin, all receive benefits from its more wholesome condition. Holloway's Purifying Pills operate directly, powerfully, and beneficially upon the whole mass of blood, whether venous or arterial. They strengthen the stomach, excite the liver and kidneys, expel disease, and prolong existence.

# THE "ARCHIMEDEAN" AMERICAN LAWN MOWER

WAS AWARDED

## HIGHEST PRIZE AT PARIS EXHIBITION, 1878;

and the Jury in their Report say:—

### "The 'Archimedean' did the best work of any Lawn Mower exhibited."

*The "Archimedean" was the only Lawn Mower used, and specially selected in preference to all other Mowers for Cutting the Grass on the most conspicuous parts of the Paris Exhibition Grounds. Also awarded*

GRAND DIPLOMA of HONOURABLE MENTION, Vienna, 1873 | SILVER MEDAL, Vienna, 1870. | SILVER MEDAL, Hamburg, 1869.

NOTE.—The "Archimedean" was specially selected from the Mowers exhibited at Vienna for constant use in the Exhibition Grounds, and gave great satisfaction; and we have pleasure in calling attention to the following Testimonial, received from the Inspector of the Royal Gardens, Schönbrunn, Vienna:—

"Your 'Archimedean' Lawn Mowers have been used for some time past at the Imperial Gardens, and I have great pleasure in stating that they have given perfect satisfaction. Their quick and good work prove them to be the best and most efficient machines of the kind."

### OPINIONS OF THE PRESS

"The quickest, most simple, and most efficient Mower ever used."—*Gardeners' Chronicle.*

"Far superior to any of ours."—*The Field.*

"Remarkably easy to work."—*Gardeners' Mag.*

"We feel bound to recommend it to our readers as one of the best Mowers we have as yet made acquaintance with."—*Floral World.*

### PATRONIZED BY

HER GRACIOUS MAJESTY THE QUEEN,  
HER IMPERIAL MAJESTY THE EMPRESS OF GERMANY,  
THE LATE EMPEROR OF THE FRENCH,

HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
HIS IMPERIAL MAJESTY THE EMPEROR OF AUSTRIA,  
THE VICEROY OF EGYPT,

And many of the Nobility and Gentry of Great Britain.

### CHIEF ADVANTAGES.

They are extremely LIGHT IN DRAUGHT, SIMPLE IN CONSTRUCTION, WELL MADE, and NOT LIKELY TO GET OUT OF ORDER.

They Cut LONG or SHORT, WET or DRY Grass, and do not clog.

They have no ROLLERS in FRONT of the Cutter, and therefore Cut the Grass as it GROWS, and do not miss the BENTS.

They work well on SLOPES, STEEP EMBANKMENTS, UNDER SHRUBS, and Close up to Trees, &c.

They can be USED either WITH or WITHOUT GRASS BOX, as may be desired.

### TESTIMONIALS.

From A. F. BARRON, Esq., Royal Horticultural Society, Chiswick Gardens, W.

"GENTLEMEN,—We have now had your 'Archimedean' Lawn Mower in use for several months, and without hesitation I can truly say it is the best and most efficient implement of the kind we have ever used."

From SHIRLEY HIBBERD, Esq., F.R.H.S., Editor of the "Gardeners' Magazine."

"The 'Archimedean' Lawn Mower has been in constant use in our experimental garden since Midsummer last, and has done its work remarkably well. It is a good sign when the men who have to do the work take to a thing of this sort without any persuading, and my men evidently regard it as a magical means of making mowing an amusement, for they fly through the work and enjoy the perfect shave quite as much as I who look on, and wonder we have so lately attained to real simplicity."

From the Rev. A. McALLISTER, Plumstead Vicarage, London.

"I have the pleasure of forwarding a cheque for the 'Archimedean' Lawn Mower which I had from you, and which does its work admirably."

Nursery Stock.—Nursery Stock.

To NURSEYMEN, GENTLEMEN PLANTING, and OTHERS.

MR. JOSEPH WALTON has been favoured with instructions from the Executors of the late Mr. Charles Ridgway, of Romley, near Stockport, to SELL by AUCTION, on MONDAY, TUESDAY, WEDNESDAY, and THURSDAY, April 12, 13, 14, and 15, to commence each day at 12 o'clock, the following VALUABLE NURSERY STOCK, including about 500 specimen Green Hollies, from 3 to 10 feet high, and from 2 to 7 feet through; 400 variegated specimen Hollies, in variety, from 3 to 10 feet high; a great number of ornamental Green Hollies, specimen plants, in named varieties; likewise a number of Hollies of various sorts in smaller plants; 2500 Aucuba japonica, including many magnificent specimen plants, from 2 to 6 feet high; also upwards of 80,000 smaller Aucuba japonica; 100 specimen Handsworth Box, from 3 to 7 feet high, first-class plants; 800 ditto, 12 to 24 inches high; 600, 6 to 12 inches high; also a great variety of ordinary Nursery Stock, including Fruit Trees, &c. The plants are in first-rate condition, are beautifully grown, and have all been recently removed.

The place of sale is within two minutes' walk of the Romley Station on the M. S. and L. and Midland lines of Railway. Catalogues may be had from the Auctioneer, Wilmslow, or from the Nurseries, four days before the Sale.

Tree Ferns.

MR. J. C. STEVENS will include in his SALE on WEDNESDAY, the 14th inst., a quantity of TREE FERNS, with stems from 5 to 8 feet high, just arrived from Australia in excellent condition; also a few of the new, handsome, and rare CYCAS MEDIA, with stems 4 to 6 feet high, imported from Queensland.

May be viewed the morning of Sale, and Catalogues had.

Established and Semi-established Brazilian Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, April 14, at half-past 12 o'clock precisely, BRAZILIAN ORCHIDS, consisting of the new, rare and beautiful Lelia Dormaniana, discovered by Mr. H. Hunt in September last, and described by Professor Dr. Reichenbach in the Gardeners' Chronicle, February 7, 1880, p. 168; the rare and lovely Oncidium Gardneri, described by Dr. Reichenbach as a glorious Oncidium, far superior to Oncidium curtipendula (see Gardeners' Chronicle, January 10, 1880, p. 40); Oncidium concolor, O. dasyle, O. Forbesii, O. crispum, Cattleya marginata, C. Schilleriana, and C. amethystina, from Mr. R. Bullen, of Lewisham. Also an importation of INDIAN ORCHIDS, just received, direct, in good condition. A consignment of BLUE DISAS, just arrived, in good condition, by order of Messrs. E. G. Henderson & Son.

May be viewed the morning of Sale, and Catalogues had.

Immense Importation of ODONTOGLOSSUM ALEXANDRE.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on Thursday, April 15, at half-past 12 o'clock precisely, a grand importation of ODONTOGLOSSUM ALEXANDRE, the Queen of the Odontoglossos. The consignment may safely be termed the largest and finest ever offered, being in most splendid condition, and consisting chiefly of masses of unusual size, freely set with healthy short breaks. The whole of the importation will be offered. The sale will also include a variety of other ORCHIDS, and a new very beautiful LYCOPODIUM brought home by Mr. Freeman from India.

May be viewed the morning of Sale, and Catalogues had.

Cattleya superba.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 22, at half-past 12 o'clock precisely, a splendid consignment of CATTLEYA SUPERBA, just received from the interior of Guiana. The specimens are in grand health, full of leaves and fine plump eyes, and the importation consists of many masses, with upwards of thirty bulbs, which will speedily make Exhibition Plants. The varieties are the very best, and the old flower-spikes show that this truly superb Cattleya makes as many as nine of its beautiful large flowers on a spike.

May be viewed the morning of Sale, and Catalogues had.

Henbury Hill, Gloucestershire.

About 3 miles from Bristol and Clifton. SALE of the VALUABLE PLANTS belonging to the Estate of the Rev. James Heyworth, deceased.

MESSRS. H. R. FARGUS and CO. will SELL by AUCTION, on the Premises, at Henbury Hill, on TUESDAY and WEDNESDAY, April 13 and 14, at 11 o'clock each day, all the exceedingly Choice and Valuable COLLECTION of STOVE and GREENHOUSE PLANTS, belonging to the above deceased gentleman: comprising a choice assemblage of rare Orchids, including Phalaenopsis Schilleriana, one spike with 85 flowers; Angreicum sesquipedale, four spikes with 12 flowers; P. grandiflora, has had 43 flowers on one spike; P. amabilis; Vanda tricolor; Aerides maculosum, suavisimum; Oncidium Marshallianum, Cyrtopodium niveum, Stonei, villosum, insignis, Veitchii, Sedeni; Cattleya Mendelli, Loddigesii; Dendrobium fimbriatum, oculatum, nobile, &c.; a variety of large fine Camellias and Azaleas, Lapagerias, Dipladenias, Gloxinias, Achimenes, Ferns, Pelargoniums, and an immense variety of other Stove and Greenhouse Plants. The whole of the Plants are in good condition, the Orchids free from spot, and all tender plants will be hardened for removal.

The Plants may be viewed the day preceding the Sale. Catalogues may be obtained of Mr. R. SHORE, Henbury Hill; or of the Auctioneers, 4, Clare Street, Bristol.

Reigate.

To GREENGROCCERS, FRUITERERS, and OTHERS.

Uninjured by Frost.

EVERGREENS.—In splendid condition for safe removal; having been regularly transplanted and growing in a very exposed situation, are very hardy and robust, thus having withstood the past excessively severe winter without injury.

With reference to the hardy nature of the Trees and Plants reared in these Nurseries, a customer in Yorkshire writes:—"I am very well satisfied with the Roses you sent—the frost has not hurt them, whilst a lot I got from the South have suffered very much."

CATALOGUES on application.

JAMES DICKSON and SONS, Newton Nurseries, Chester.

Wandsworth Common and Garret Lane Nurseries.

R. AND G. NEAL beg to call the attention of Gentlemen, Builders, and the Trade to their large and varied Stock of HARDY ORNAMENTAL, FOREST, FRUIT TREES, ROSES, SHRUBS, &c., grown at their Nurseries, which comprise 70 Acres of a remarkable collection of those Plants and Trees most suitable for growing in or near large towns. An early inspection is solicited. All goods delivered free on rail in London or at own residence within six miles of the Nurseries. CATALOGUES free by post on application.

New Zonal Pelargonium.

WEST BRIGHTON GEM. To be sent out in May, 1880. This has been awarded a First-class Certificate as a New Plant by the Brighton and Sussex Horticultural Society, and a Cultural Commendation by the Royal Horticultural Society. Price 10s. 6d. each, two for 20s. (usual allowance to the Trade). As the stock is limited, orders will be booked and executed in strict rotation.

For further particulars see the Times of December 17, 1879, the Journal of Horticulture of December 18, the Gardeners' Chronicle of Dec. 20, and for full description and CATALOGUE apply to WILLIAM MILES, West Brighton Nurseries, Cliftonville, Sussex.

JAMES LYE'S NEW FUCHSIAS for 1880, for which he obtained four Certificates of Merit during 1879 at the leading West of England Shows, are now ready. LYE'S FAVOURITE, white tube and sepals, rich magenta corolla. Flowers of fine form, borne in elegant clusters. Plant of good habit and strong grower: 5s. per plant. BEAUTY OF THE WEST, white tube and sepals, corolla bright vermilion-scarlet: 5s. per plant.

The above have been highly reported of in the Gardeners' Chronicle, October 25, in the Journal of Horticulture, and Gardeners' Year Book. A Coloured Illustration of "Lye's Favourite" can be had of JAMES LYE. Price 1s. 3d. each. Post-office Orders made payable to JAMES LYE, Market Lavington Office.

The usual Discount will be allowed on all trade Trade orders. Cash with order. JAMES LYE, Amateur Fuchsia Grower, Market Lavington, Wills.

**TREES FOR AVENUE, PARK, or STREET PLANTING.**  
**ACER DASYCARPUM**, 14 to 16 feet, girding 5 to 7 inches.  
**CHESTNUT**, Horse, 12 to 14 feet, girding 5 to 7 inches.  
 " Horse, 14 to 16 feet, girding 8 to 10 inches.  
 " Horse, Scarlet, 10 to 14 feet, girding 6 to 8 inches.  
**LIMES**, 14, 15, 16, 18, and 20 feet, girding 6 to 10 inches.  
**PLANES**, Occidental, 10 to 12 feet, girding 4 to 5 inches.  
 " Occidental, 12 to 14 feet, girding 5 to 6 inches.  
 A few hundred Spanish PLANES, 16 to 18 feet, girding 8 to 10 inches.  
**POPULUS CANADENSIS NOVA**, 12 to 14 feet, girding 6 inches.  
**MAPLES**, Norway, 12 to 16 feet.

# IMMENSE IMPORTATION OF ODONTOGLOSSUM ALEXANDRÆ.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 15, at half-past 15 o'Clock precisely,

## A GRAND IMPORTATION OF ODONTOGLOSSUM ALEXANDRÆ, THE QUEEN OF THE ODONTOGLOTS.

The consignment may safely be termed the largest and finest ever offered, being in most splendid condition, and consisting chiefly of masses of unusual size, freely set with healthy short breaks.

**THE WHOLE OF THE IMPORTATION WILL BE OFFERED.**

The Sale will also include a variety of other ORCHIDS, and a new, very beautiful LYCOPODIUM, brought home by Mr. Freeman, from India.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN. LONDON, W.C.

### 'A Change of Seed always Pays.'

JAMES CARTER & CO., have received a Consignment of the following varieties of AMERICAN-GROWN POTATOS, selected for them from the finest crops of the year:—

SNOWFLAKE  
BRESEE'S PEERLESS  
BROWNELL'S BEAUTY  
LATE ROSE

Lowest Price per Barrel on application.

They are offered in Barrels, weighing about 163 lb each, as received (as Messrs. CARTER do not Hand-pick these POTATOS, in the usual manner), and they must be taken with any risks and imperfections, and subject to being unsold.

20s. value Carriage Free. | 5 per Cent. for Cash.

THE QUEEN'S SEEDSMEN,  
HIGH HOLBORN, LONDON, W.C.

#### PEDIGREE ROSES.

The greatest success yet achieved in the production of new Roses is the Stapleford Pedigree Roses.

DESCRIPTIVE LISTS post-free, including the striped Tea Rose American Banner, and the beautiful crimson climber, James Sprunt; this list: Rose can only be obtained in England from my establishment. H. BENNETT, Manor Farm Nurseries, Stapleford, Salisbury.

#### TO EXHIBITORS.

FOR SALE, the property of a Nobleman who is giving up showing,  
THREE MAGNIFICENT SPECIMEN PLANTS, as under:—

STATICE PROFUSA, in 18-inch pot, 3 feet high, 5 feet diameter.  
Considered by many to be the finest specimen of its kind in the country.

ERICA CAVENDISHII, in 20-inch pot, 3 feet high, 5 feet diameter.

PIMELEA DECUSATA ROSEA, in 22-inch pot, 2 feet 6 inches high and 5 feet diameter.

These are three splendid plants, perfectly healthy, and full of flower-buds. Apply to

JAMES HAIN, Crossway House, Holmer, near Hereford.

#### TEA SCENTED ROSES

For Planting Out or Greenhouse Culture.

Upwards of 20,000 strong, well established plants, in pots.

List and Prices on application to

GRANSTON'S NURSERY & SEED COMPANY, Limited,  
KING'S ACRE, near HEREFORD.

#### MYOSOTIS ELEGANTISSIMA.

NEW SILVER-EDGED, BLUE-FLOWERED FORGET-ME-NOT.

RODGER, McCLELLAND AND CO. are now prepared to send out this sterling novelty, probably the most valuable hardy plant ever distributed. Its habit is dwarf and very free, every leaf being broadly margined with silvery white. The effect of the bright blue flowers upon the white variegation can be imagined, but not easily described. It is quite hardy. The last severe winter has had no effect whatever upon it. Planted in various situations, in damp places and in dry places, in vases frozen through, the result is the same—quite uninjured. As a spring bedding plant is perhaps its special mission, but in partially shaded places it is also invaluable as a summer bedding plant. See *Garden*, March 20.

Good plants, in pots, 3s. 6d. each; 3fs. per dozen.  
Special prices per 100 and per 1000.  
Trade price on application.

64, HILL STREET, NEWRY.

#### MANGEL SEED.

JOHN SHARPE can offer to the Trade well harvested SEED, and of full growth—Crop '78. Samples and Prices of ORANGE GLOBE, YELLOW GLOBE, INTERMEDIATE and LONG RED on application.

Bardney Manor, Lincoln.

#### To the Trade.

GARAWAY AND CO. offer:—

PELARGONIUMS, show and fancy, choice varieties, good bushy plants, to bloom in May, in 48-pots, 50s. and 6s. per 100.

CHRYSANTHEMUMS, large-flowered Japanese and Pompons, in 3-inch pots, 25s. per 100.

DAHLIAS, named varieties, in thumbs, 20s. per 100.

DELPHINIUMS, best named sorts, single and double, 5s. per dozen, 35s. per 100.

PYRETHRUMS, double, best named sorts, 20s. per 100.

PHLOX, herbaceous, best leading sorts, 4s. per dozen, 25s. per 100.

GARAWAY AND CO., Durdham Down Nurseries, Clifton, Bristol.

### CHRISTIAN ANNUAL, 1880.

(Extract from.)

#### FLOWERS ALL THE YEAR ROUND.

A BAD SEED TIME AND HARVEST have passed away, and we have entered on a new year, which every one hails with new hope. On the part of all who have suffered or been disappointed during the past year in the produce of their flowers there will certainly be more careful looking out for the best seeds this spring than usual; for though the best seed may fail when circumstances are unfavourable, it is the good seed selected with professional skill from year to year from the best strains that weathers the storm, or springs with rebounding fruitfulness to the genial influences of sun and air. We do not know any firm in England of whom we can speak with more confidence in this respect than Mr. HENRY CANNELL, F.R.H.S., Swanley, Kent. He has all the motive of long-established reputation and experience not to fail when an emergency comes, and any one who looks over his *Floral Guide* will see that he is fully prepared for season 1880. In choice Florist Flower Seeds he has been celebrated for a long period, and the result of his careful and continuous selection from seeds of the most perfect type has been universally acknowledged, and have been elaborated with such constant skill and attention from year to year that they have attained a finity of type and merit which is not to be found in the market. They are of the choicest, and in many instances the entire strains far onward to those usually offered, so much so, that the Council of the Royal Horticultural Society awarded him their large Gold Medal for general excellence of his flowers and the number of plants and seeds that he exports into every nook where the English and foreign posts find their way is wonderful.

THE HOME FOR FLOWERS  
SWANLEY KENT.

Is now recognised by practical men throughout the United Kingdom as the best Manure that has ever been manufactured.

This Manure is composed of highly concentrated animal matter, and is entirely different from Guano, Nitrate of Soda, and all Chemical Manures, which are merely stimulants, and in the end exhaust and deteriorate the soil. It is really a Plant Food, and all Crops appear to benefit in a most remarkable manner from its application. It is now being used most successfully

- For all Farm Crops,
- For all Kitchen Garden Crops,
- For Lawns and Flower Gardens,
- For Vines and Strawberries,
- For Melons and Cucumbers,
- For all Soft-wooded Plants,
- For all Stove and Green-house Plants,
- For Camellias, Azaleas, and Gardenias.

Sold in Packets 1s. each, and in Bags,  
 ¼ Cwt.    ½ Cwt.    1 Cwt.  
 7s. 6d.   12s. 6d.   20s.  
 SPECIAL QUOTATIONS BY THE TON.

By Permission of the Hon. Board of Customs.  
 (Free of Duty.)

# CORRY & SOPER'S NICOTINE SOAP (PATENT).

An effectual and speedy Eradicator of Scale, Thrips, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting Plants, without injury to Foliage.

It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is Nicotine, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with Perfect Safety to Foliage.

It may be used as a Dip or Wash for any description of out or indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from some hundreds lately received from men of considerable experience:—

Messrs. J. & J. HAYES, Nurserymen, Edmonton, London, N. on Feb 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who have anything to do with plants or fruit growing, as it is so very useful for dipping and syringing when it is not convenient to fumigate. You are quite at liberty to make what use you please of this."

Messrs. OSBORN & SON, The Fulham Nurseries, London, write:—

"We have given your Nicotine Soap a fair trial, and our experience confirms the character you give it, that it is an unrivalled preparation for killing insect life, without injury to plants."

Mr. E. MALLER, Burnt Ash Nursery, Lee, London, S.E., on Feb. 21, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must now say it is very satisfactory. I am now having it used freely for syringing, ½ pint to 4 gallons of water, without the least injury to the foliage."

Mr. J. C. SPYERS, Orchid Grower to Sir Trevor Lawrence, Et., Burford Lodge, Dorking, on Nov. 24, 1879, writes:—

"I have now tried in many ways your Nicotine Soap as an insecticide for Orchids, and it has given me great satisfaction," &c.

Messrs. BARNWELL & TILBURY, Nurserymen, Worthing, on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we can with pleasure say it is the most useful insecticide that has ever come under our notice. We have tried it on Strawberry plants when in bloom, and find it most effectual in destroying the fly, whilst it does not in the least injure the plants or flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ABBEY, Gardener to C. M. Palmer, Esq., M.P., Grenkle Park Garden, Saltburn-by-the-Sea, on February 20, 1880, writes:—

"The Nicotine Soap I had from you I find a safe and powerful insecticide, being destructive of every kind of insect infesting plants, and in no instance has any injury been done to the foliage. At a strength of 3 oz. to a gallon of water, I have used it for syringing Peaches during growth for the destruction of red-spider, without injury in any way (only to the insect!—which it instantly kills). At that strength to 4 oz. to the gallon it may, with perfect safety, be employed for syringing every description of fruit tree, whether under glass or outdoor, and a majority of plants, without the least injury, whilst at the same time it destroys aphides—green, brown, blue, and black—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon of water, I have employed it very successfully for destroying mealy-bug, brown and white scale, both by syringing the plants and applying with a brush, its effects upon the insects making its application gratifying; whilst from its grateful smell, it is pleasant than otherwise. At a strength of 8 oz. to the gallon, I found it a first-rate winter dressing for fruit trees, mealy-bug on Vines, as well as a destroyer and preventive of red-spider, thrips, and aphides. It also destroys American blight."

The following Nurserymen authorise us to say they have used the Nicotine Soap with unqualified satisfaction:—

J. Laing & Co., Forest Hill, London, S.E.; Hawkios & Bennett, Twickenham, S.W.; G. Edwards, Balham, S.E.; James Walton, Lee, S.E.; D. S. Thomson, Wimbledon, Surrey; F. & A. Smith, Dulwich, S.E.; J. Peard & Son, Roupell Park, Lower Norwood, S.E.; G. Brand, Winchmore Hill, N.; Hooper & Co., Covent Garden, W.C.; Lucombe, Pince & Co., Exeter; Edwin Cooling, Derby; T. Frost & Sons, Maidstone; W. C. Drummond, Bath; G. & W. Yates, Manchester; W. Bryant, Rugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aberdeen; J. Charlton, Tunbridge Wells; Edmonson Bros., Dame Street, Dublin, &c.

Sold in jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in tins, 14 lb., price 15s. 6d.; and drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use upon each package.

And 2 oz. sample jars, 6d. each.

Full directions for use on each package.

TO ENSURE THE BEST LAWNS SOW

SUTTON'S MIXTURE OF FINE GRASSES and CLOVERS.

For making New Lawns, &c., sow 3 bushels (or 60 lb) per acre; for improving the sward sow 20 to 30 lb. per acre. Price 1s. per pound; 20s. per bushel. Carriage free.

SUTTON'S PRIZE LAWN GRASS SEEDS

Produced three beautiful Lawns at the Paris Exhibition, 1878 (see above illustration, taken from a photograph), which were awarded a Prize Medal, and thus referred to by L'Echo Agricole, November, 1878:—

"The Lawns shown by Messrs. Sutton's Agent are at least equal in beauty, vigour, and luxuriance to those shown by any other exhibitor. They are of extraordinary beauty and evenness, and form throughout one charming velvety carpet."

From the Rev. T. H. F. HICKS, St. Michael's Home.

"The Grass Seeds with which you supplied me in April last have produced a very good lawn. The herbage is so fine and close that many persons who have seen it have supposed it must have been laid down with cut turf, and would hardly believe it was only sown this year."

From Z. HUNT, Esq., Berecrofts, Earl's Colne.

"I have got a magnificent Lawn with the Grass Seeds you supplied me. It is the admiration of the neighbourhood."

From T. E. GRAHAM, Esq., Abingdon.

"About two years ago you supplied me with some Lawn Grasses and Clovers which have made some of the best Lawns I have ever seen, and I now want to add to them."

From A. E. SEYMOUR, Esq., Teddington.

"The Lawn sown with your seed last September has far exceeded my most sanguine expectations."

SUTTON'S PAMPHLET ON Laying Down and Improving Lawns, Gratis and post-free on application.

THE Gardeners' Chronicle.

SATURDAY, APRIL 10, 1880.

MANURE WATER.

THAT water charged with manurial elements has a powerful influence upon vegetable life is so well known to those who cultivate plants of almost every description as to require no affirmation, yet there is often a wide difference of opinion amongst those who are so engaged as to the value of the different liquid fertilisers or stimulants generally used, some maintaining that it is better to apply manure in a solid state, and that the majority of liquids so used are often only stimulative in their influences, producing little, if any, permanent good. I well recollect the time when this estimate of manure-water, even amongst gardeners, was much more prevalent than it now is; neither is it difficult to account for the difference of opinion that once was so general on the subject, and which to a less extent still exists. The many various solid manures now in use are simply so much food, varying in their influences upon the plants to which they are applied according to the different elements of which they, the manures, are composed, almost as much as do the various articles of diet consumed and assimilated by animals. A given kind of manure may be the best possible for some particular species of plant, affording all the elements requisite to build up and sustain it, and still be of little value to another plant that requires something essentially different for its support. Through the joint result of chemical researches and advanced knowledge in cultivation this is now better understood than it used to be, but the fact is not always realised, that the effect of manure in a liquid state must necessarily be in accord with that of the solid matter which is used to make it. For instance, soot is one of the most exciting stimulants known, quickly becoming exhausted, after which, unless something else is at hand to sustain the exuberant growth thus excited, the plant languishes to a greater extent than it would have done if the extra growth made through the effects of the soot had been non-existent. Guano has a tendency in the same direction, but does not so soon become exhausted, and from the high amount of ammonia it contains, it promotes large and rapid growth, especially in quick-growing plants, more particularly those that are of a succulent nature. The various animal excremental manures are possessed of fertilising, as well as lasting, properties, in a great measure proportionate to the description of food the animals are fed with: for example, the manure from cattle fed on hay and corn is much richer than if the food consisted of grass and roots; and if a liberal allowance of oil-cake is given to the animals in addition, the strength of the manure will be still further increased. Purely animal manures vary considerably in strength, and their enduring properties in a great measure are ruled by their rate of decomposition. Manures composed of the blood and flesh of animals are extremely

powerful, quick in action, and last well, but not nearly so long as the hair, horns, hoofs, and bones, which are so much slower in decomposing. This is nothing new, as all who have given the least attention to such matters are fully cognisant of it, as also of the fact that liquid manure, prepared in the usual way by the admixture of water with some solid manurial matter, must of necessity possess fertilising elements identical with that of the solid matter to which it owes its fertility, the potency of the liquid being proportionate to the solubility of the solid matter, of course governed by the extent of dilution. It thus follows that whenever liquid manure is given to a plant, it needs to contain such elements as the plant requires to build up its several parts. And I have no doubt that it is through an absence of knowledge, or want of due attention as to the suitability of the manure-water used to the particular kind of plants to which it is applied, and its frequent deficiency in the elements required

made from urine of the various domestic animals—horses, cattle, and pigs—each kept separate and free of soakings from solid fecal matter. I applied it to plants varied in their character, and ranging over most of the different subjects usually cultivated on farms and in gardens, outdoors as well as under glass. As a matter of course the extent of dilution was varied according to the natural ability of each kind of plant to take strong food. Things like Rhubarb, Celery, Raspberries, Black Currants, Chrysanthemums, Mangel Wurzel, and Cabbage, as will be easily understood, grew vigorously with doses of a strength that would have destroyed slower growing things. I continued the experiment for several years to see what would be the effects on the plants, particularly such subjects as the Black Currants and Raspberries, and in no case did I find any ill-effects where the liquid was given in moderation, and never in a stronger state than the plants could bear. In all cases the urine was considerably stronger, and conse-

lative in their effects. This verdict I find is confirmed by several extensive plant-growers whom I have advised to use it; but, like everything of a similar nature, being strong, it must be used with caution—even for such subjects as Chrysanthemums it should be diluted to the extent of something like six or seven parts of water to one of urine, for weaker growing plants still further reduced, and, as with all liquid manures, only given when the plants are making growth. At the time a plant is put out in the open ground, or placed in a pot or other confined space, solid manure, in quantity limited by its nature and strength, as also by the ability of the plant to absorb and assimilate food more or less freely, can be given; but beyond this we cannot go, as if too much manure is present in the soil its effects are identical with those which result from an animal taking food stronger than the digestive organs are able to digest and assimilate. It thus follows that after a time the manure first present within reach of the

REFERENCES TO PLAN:—A, Eranthis; B, Aubrietia; C, Heath; D, Red Daisy; E, White Daisy; F, Bellis perennis auctobæfolia; G, Myosotis dissitiflora; H, White Arabis; I, Blue Pansy; J, Golden Thyme; K, Red Daisy; L, Pyrethrum Golden Feather; M, Aubrietia; N, Myosotis dissitiflora; O, White Arabis; P, Pansy; Q, Daisies; R, Sedum; S, Grass.

by the plants, that it does not answer, and consequently is condemned as of little use; whereas, if it had been given to such other species of plants as required the particular fertilising ingredients it contained, the results would have been satisfactory, and the verdict as to the non-value of the fertiliser reversed.

The advantages derivable from the use of manure in a liquid form when judiciously applied, are, under many circumstances, such as not to be had by the use of solid matter. The effect of liquid solutions made from the dung of animals ordinarily used for the purpose, such as that of horses, cattle, sheep, and deer, is sufficiently understood, some giving preference to one, some to another of these. The powerful influence that urine, when applied to plants, exerts on growth, has also long been known; but the way that it is usually employed—more or less mixed with the soakings or drainings from solid excrement—prevents the possibility of a correct estimate being formed of its potency and relative value as compared with other manures applied in either a solid or a liquid form. Some years ago I tried the effects of manure-water

quently required more dilution when the animals were fed on dry food than when they had access to plenty of green stuff, as when out at grass, or with as many roots as they could consume. The relative strength stood thus—that from the horses first, pigs second, and cows third. But the strength alone was far from giving the true line as to their comparative manurial value, either for things of an annual nature, such as ordinary garden vegetables, or fruits, or pot plants, whether the latter are soft-wooded and quick growing or hard-wooded and of slow growth. With all, especially those of an enduring character, the cow urine told an unmistakable tale, not alone in the production of wood and foliage unequalled in vigour, but plants to which it was given exhibited a disposition to produce flowers in quantities that I have never seen result from the use of any other liquid fertiliser. Another important matter in connection with the use of this urine is, that plants to which it is applied regularly for a number of years continue to make growth exceptionally strong without any indication of exhaustion such as invariably follows the use of manures that are only stimu-

lative in their effects. This verdict I find is confirmed by several extensive plant-growers whom I have advised to use it; but, like everything of a similar nature, being strong, it must be used with caution—even for such subjects as Chrysanthemums it should be diluted to the extent of something like six or seven parts of water to one of urine, for weaker growing plants still further reduced, and, as with all liquid manures, only given when the plants are making growth. At the time a plant is put out in the open ground, or placed in a pot or other confined space, solid manure, in quantity limited by its nature and strength, as also by the ability of the plant to absorb and assimilate food more or less freely, can be given; but beyond this we cannot go, as if too much manure is present in the soil its effects are identical with those which result from an animal taking food stronger than the digestive organs are able to digest and assimilate. It thus follows that after a time the manure first present within reach of the

There can be no question that the time of active growth in both roots and branches, the spring and summer, is the proper season for using manure-water; and where plants exist that want assistance in this way, especially such as are naturally of a hard-

growth commence in either the roots or the shoots, otherwise the first efforts of the shoots will be weak, and no subsequent application of manure during the ensuing summer will in that case strengthen them so as to make the collective growth equal to what it would have been if the food they required had been within their reach at the time they began to grow. A matter requisite to keep in view is, that at the time when any plant is just in the height of its growth it will then bear manure-water being given more freely than either at the beginning or later in the season. Another thing of quite as much importance, and which those who are first commencing to grow any kind of plants will find it to their advantage to note, is, plants have not the power to reject the food that is brought in contact with their roots in the way that manure-water is: whether the water they thus imbibe is sufficiently or overcharged with food, they

vious to water afterwards. *T. Baines.*

## THE SPRING FLOWERS AT BELVOIR CASTLE.

THERE is always a freshness of beauty attached to a garden of spring flowers that there is not to their more gaudy summer rivals. It was not a bright, genial day on March 22 when we visited the far-famed gardens at Belvoir, for the wind was blowing steadily from the north, the air was keen and chilly, yet the scene in the flower gardens was one of matchless splendour. It has been a great point with Mr. Ingram to obtain an early spring display, this year he has admirably succeeded, and is rewarded by having the spring flower gardens quite as bright by the middle of March as we expect to find them by the second or third week in May. Some of the beds were marvels of perfection, so bright and profuse were the flowers. The alpine Rhododendrons, the Saxifraga

at Belvoir it is highly appreciated, and stands first and foremost for flower garden embellishment. Wall-flowers are remarkable for their even regular growth. We were too early to see them at their best, yet they gave promise of fine masses of bloom.

As we passed along the various terraces and through the rock gardens, admiring their many beauties, we could not avoid noticing what simple materials are brought together to produce such striking results. The generality of the plants employed are such as can be found in any cottage garden, and may be grown by the humblest subject in her Majesty's dominions. The common red Daisy is grown by tens of thousands, and the mossy Saxifragas and Sedums are extensively employed. Every inch of ground is also covered, not one inch of bare soil being allowed to be seen. Violets also form an important factor amongst spring flowers. The three favourites were Victoria Regina, the best of the single Violets; Marie Louise, very large double flowers; and Belle de Chatenay, pure white double flowers. These were cultivated on a large scale.

FIG. 78.—SPRING GARDENING AT BELVOIR CASTLE.

REFERENCES TO PLAN:—A, Pulmonaria; B, Arabis; C, Purple Pansy; D, Pyrethrum; E, Heath; F, Aubrietia; G, Pansies; H, Red Daisy; I, White Daisy; J, Sedum; K, Arabis; L, Myosotis; M, Red Daisy; N, Primroses.

must take it. If it is too strong the effects are seen either sooner or later, but often when much mischief has been done. It is always well to keep on the safe side—frequent applications are very much preferable to stronger doses even when they are only slightly too strong. As a rule the slower the growth a plant naturally makes, the less able is it to bear manure-water in a strong state. Through the absence of this fact being fully seen and acted upon, there are many plants that are generally supposed to be unable to bear manure-water at all, such as the slowest growing hard-wooded greenhouse plants, Heaths in particular; yet it is in the case of these subjects, more even than stronger rooted things, which can bear partial shaking out and renewal of the soil, that assistance by the use of liquid manure is often most required. It is scarcely necessary to mention that whenever manure-water is used, even to the most vigorous-growing plant, which, consequent upon its strength, is able to bear that which would be death to others weaker, the liquid should always be clear and transparent,

ligulata, Hepaticas, Cardamine rotundifolia, with its masses of white flowers; Primulas of almost every shade of colour, but specially noteworthy were *P. auriculiflora*, with its brilliant flowers of purplish-crimson, and *P. Golden Gem*, fine sulphur; Oxlips of many shades and fine large flowers, improved strains of Cowslips, *Aralias*, *Anemone blanda*, with its bright blue flowers larger than half-a-crown; and numerous other plants, formed a galaxy of unrivalled magnificence on the terraces and rock gardens at Belvoir. Mr. Ingram has also been engaged in selecting the best forms, and improving by cross-breeding the various classes of spring flowers. In this respect he well deserves the hearty thanks of the flower-loving public, for the various masses of Wallflowers, Aubrietia, Arabis, Anemones, &c., all bore testimony to the improvement effected by careful hybridisation. What appeared the greatest marvel was the fine masses of *Saxifraga ligulata*, with the large bunches of pinkish flowers, almost equal in size to a *Hydrangea hortensis*. Then the Rhododendrons also deserve special mention. *R. præcox superbum* was just past its best, but for early work it is invaluable. There was also a seedling of the late Mr. Pearson's, with flowers of a bright pink colour; it is very hardy and free flowering. This gentleman always thought

Wherever we directed our steps they sprung about our path, and the air was redolent with their delicious odour. As we wended our course through the rock gardens we noticed that every niche and cranny contained some object of interest. In one position there would be a fine mass of *Myosotis dissitiflora*, and this would be overhung by some other plant remarkable either for the beauty of its flowers or foliage. There were fine clumps of *Pulmonaria azurea*, with its noble spikes of dark flowers; *Polygala Chamæbuxus rubra*, a dwarf shrub not more than 4 inches high, covered with dark-coloured flowers; *Erica herbacea alba*, also clothed with a profusion of white flowers.

Several choice shrubs that were found in the park gardens had withstood the severity of the winter uninjured. There was the *Azara microphylla* and *Olearia Haastii*, quite hardy; while *Ceanothus Veitchianus* and *C. Gloire de Versailles* were slightly injured. The *Bambusa Metake* proved itself quite hardy by the side of *Aucubas* that were killed by the frost.

It would be almost impossible to give a detailed description of these gardens, for they extend over many acres of ground. Near the Castle is the Duchess' garden. There may be from twenty to

thirty beds, all well filled with plants and aglow with bright colours.

Turning to the left, down in the dell, is the stately garden, also furnished with numerous beds, all filled with spring flowers. Wherever we turn the scenery is of the most enchanting character, and reminds one of what we have read of Transatlantic forests. Passing on we come to the garden in the walk. Here we have three terraces, one above another, all in full bloom. The first is planted in chains and links, the second in curves, and the third in ribbon lines. For particulars of planting, see fig. 77. Near at hand are numerous other beds filled with such plants as above enumerated. These are interspersed with clumps of Camellias, and Rhododendron Nobleum, just opening its bright flowers. There is another terrace, as shown by fig. 78, this again surrounded by masses of bright flowers. As we proceed along the main walk we notice a collection of hardy Climbers on each side the path, and scarcely have we got from the shade of the lofty trees than we come on to what may be called a fairy scene. Wherever the eye turns it rests on dense masses of flowers of every shade, from pure white to crimson and dark blue. On the right is a sloping bank, containing many beds of bright colours set in a framework of living green. On the left is another series of terraces, rising 2 feet above each other. They are sixty-five yards long, and planted with great taste. In the kitchen gardens we noticed extensive herbaceous borders, where thousands of these hardy gems were cultivated with great care. We had a hasty run through the fruit and plant houses, and found everything in excellent trim. In the latter there was one plant that appeared to us most useful either for room decoration or for cut flowers—we refer to the old-fashioned Solomon's Seal, *Convallaria Polygonatum*. Q. A.

#### TEMPERATURE OF THE SOIL DURING WINTER.

THE French physicists, Edmond and Henry Becquerel, took advantage of the intense cold prevailing at Paris last December to study the changes in temperature below the surface of the soil under various conditions. It is a widely-spread belief among farmers that when protected by a layer of snow, crops sown in the autumn are effectually guarded against freezing. This opinion, however, must lose much of its weight in view of these late observations, which we will briefly summarise.

The observations were made by means of Becquerel's electric thermometer, which consists simply of two wires isolated by a coating of gutta-percha, and soldered together at their extremities. Differences in temperature between the two places of junction cause electric currents varying in intensity with the greatness of the difference. A magnetic needle, brought under the influence of the current, registers on a dial these differences. The wires were inserted in the Jardin des Plantes at various depths, varying from 5 to 60 centimetres, and observations were made from November 26 to the close of December. Frost first appeared in the Garden November 26. December 3 snow fell in abundance, and the temperature of the air sank to  $-11^{\circ}$  C. The layer of snow was 25 centimetres deep. December 10 the temperature had sunk to  $-21^{\circ}$ , and commenced then gradually to rise. December 15 the snow was 19 centimetres in depth.

Coming now to the observations made below the surface of the ground under the above circumstances, we find at once a striking difference between the results obtained in soil covered with grass, and those obtained below a bare surface of the ground. In soil protected by grass, before as well as after the snowfall, at all depths below that of 5 centimetres, the temperature never descended below  $0^{\circ}$  C. Registering  $3^{\circ}5$  at the depth of 5 centimetres on November 26, it slowly sank to  $0^{\circ}18$  on December 14. The presence of grass would appear, then, to effectually protect the earth beneath it from freezing at the lowest temperatures attained in our climate. Quite different results, however, are yielded in the absence of grass. In this case at a depth of 5 centimetres the thermometer sank below zero on November 27. Two days later it registered  $-2.6$ . On December 3, just before the snowfall, it reached its minimum of  $-3^{\circ}17$ . After being covered with snow it registered  $-0^{\circ}8$ , and later  $-1^{\circ}4$ . The snow here appears to act in a certain measure as a

screen against changes in temperature, but its conductive properties are still too marked to prevent these changes from being felt sensibly at a certain depth in the earth. In the case of the agriculturist, this slow conduction, when united to the still slower conductive properties of a tolerably thick layer of dead shoots of cereal crops sown in autumn may frequently ensure immunity from freezing to the roots below the surface. T. H. N., in "Nature."

#### THE LATTICE LEAF OF MADAGASCAR.

OUIVRANDRA FENESTRALIS is becoming one of the rarest of cultivated water-weeds in our gardens, and that it is so is much to be regretted, since it represents a phase of leaf-formation which is unique as well as beautiful. There are still a few places where it may be said to have almost naturalised itself, inasmuch as it reproduces itself by means of seeds, but in many more instances its culture is a struggle nearer akin to failure than to success; and in some cases, try what one may, the plant "dies out" or lingers in a more or less unhealthy state. In some cases the water—or rather foreign matter held in solution by the water—may be the cause of its failing to attain to a luxuriant state of growth; in other cases soil, or temperature, or neglect even, may be the cause of its decadence. This being so I ventured to ask a gentleman who has long been successful in growing the plant for his cultural *regime*, a request which he kindly granted, as follows:—

##### "OUIVRANDRA FENESTRALIS."

"It is a matter for regret that this interesting plant is growing 'smaller by degrees and not beautifully less,' even in many of those gardening establishments where we have been accustomed to see and hear of the splendid proportions to which their several individual specimens had attained.

"Having been more or less successful in the growth of the plant, which has been under my charge for more than twenty years, I have been requested to give an account of my method of growing it. To this request I willingly accede, hoping that it may prove of service to beginners, and that it perhaps may cause a few of the 'old stagers' who are still 'masters of the situation' to give a few of their 'wrinkles' to the gardening public. The glass bowl or vessel in which our plant is grown measures 22 inches in diameter by 12 inches in depth. The compost used is three-fourths of good fibrous loam, one-fourth coarse Bedfordshire sand, to which I have sometimes added a little well-decayed manure. I then put it into the vessel to the depth of from 3 to 5 inches, slightly raising the soil towards the centre, where I place the plant, taking care not to break any of the roots or growth; then the whole surface of the soil is covered with Derbyshire spar, quarry stone, or shingle of light colour—broken oyster shells will answer quite as well. The twofold object of this surfacing is to keep the soil in its proper position, and to show to advantage the remarkable formation of the leaf. I next fill the vessel up to the brim with pure rain-water heated to a temperature of  $80^{\circ}$  Fahr., using a fine-rosed watering-pot for the operation. The plant is then placed in the East Indian Orchid-house in a nice light position on the north side, the vessel being immersed to about three-fourths of its depth in a warm-water tank filled with Nymphaeas, Vallisneria, and other aquatics, with which the Ouirandra associates very well. One of the principal requirements of this plant is, that it be supplied with a certain amount of fresh water daily.

Some growers empty out the whole of the water once or twice a week. This mode of procedure is, to my way of thinking, very objectionable; for, do it as carefully as possible, even with an india-rubber tube to act as a syphon, or by any other means, it causes a displacement of the soil, which settles on the leaves, and if not very carefully removed soon disfigures them. Another objection to this style of cultivation is, that the leaves and surface-roots of the plant are exposed to the atmosphere for a shorter or longer period, and be this period ever so short it is a condition of things which oft-repeated is almost certain to throw the plant into ill-health. My method of adding fresh water is to give the plant daily a small panful of tepid rain-water, using a fine-rosed watering-can for the purpose, and causing the water to run over the edges of the vessel, and thereby displacing any conferva or dirt that may have settled on the surface of the water.

If at any time any conferva or any sediment should be seen adhering to the leaves of the plant, it must at once be removed as carefully as possible. I must warn growers of this extraordinary plant against increasing their stock (more especially if the plant is in good health

and making good growth) by division of the root, as I really believe that to this cause alone may be traced more of the losses and failures of which we hear so much, than to all other errors of treatment. By far the best way of increasing the stock is by allowing the seeds to fall into the vessel and so germinate naturally, as I have known them to do. Still there are times when one has no young plants, and a request is made for a bit of that wonderful plant, which almost amounts to a command, more especially (as in my own case) when the request came from Royalty itself. Resort must then be had to division."

In Madagascar the plant grows in the rivers, and its tubers or rhizomes are used as food by the natives, their name for it being equivalent to "Water Yam." There is another species or variety (*O. Berneriana*), in which the leafy tissue is more fully developed, the interstices being reduced to very narrow slits rather than lattice-like openings. This last-mentioned variety is generally supposed to be more easy of management than *O. fenestralis*, but it is suggestive to notice that of the two forms it is the rarest.

With the writer of the above paper I also wish that those who are successful in Ouirandra culture will likewise set down their *modus operandi*, in order that our garden aquaria may be more generally graced with this dainty fine-foliaged plant. The special points of interest to this end are soil or compost, aspect, shade, temperature, and mode of changing or refreshing the water in the bowl, vessel, or tank, in which the plant is grown. The geological formation whence the water supply is derived is of interest, and the condition of light or shade inimical to coniferoid growth should be noted.

The gentleman who has already so kindly acceded to my request uses rain-water—a point worthy of note; and the manner in which the water is refreshed and aerated by rain from the rose of a watering-pot is another "wrinkle" which should not be overlooked. In plant culture much depends on apparently trifling details, which nothing short of experience and great care can rightly apply, so as to be effective under altered conditions, and to this end every atom of knowledge is a great gain. *Urania*.

#### PLANT PORTRAITS.

ALPINE AURICULA A. F. BARRON, *Floral Mag.*, t. 392.—Ground colour deep maroon tinted with mauve and regularly edged or shaded with rose, centre golden. Mr. Turner.

ARISEMA UBILE, Hook. f., *Bot. Mag.*, t. 6474.—A Nepalese Aroid, the tubers of which are used for food by the hill tribes of Sikkim. The plant was flowered by Mr. Elwes, and is remarkable for its 3-sect leaves, the central segment being obovate cuneate at the base, undulate at the margins, the midrib red. The brownish spathe is covered over like a hood, and the spadix is prolonged into a long thread.

AURICULAS, FANCY, *Florist*, t. 508: 1, Captivation; 2, Picotee.—Laced alpine varieties of much merit.

CALOCHORTUS BENTHAMII, Baker, *Bot. Mag.*, t. 6475.—A small yellow-flowered species, less attractive than most of its congeners. California. Dr. Wallace, Colchester.

CLEMATIS FAIRY QUEEN, *Floral Mag.*, t. 387.—One of Messrs. Cripps' varieties, belonging to *C. lanuginosa* section. Pale flesh-colour, with a central band.

CLEMATIS LOUISE CARRIÈRE, *Revue Horticole*, January 1, 1880.—A very pretty seedling from *C. viticella venosa*. It is hardy, evergreen, very free flowering, with flowers 2 inches across, bluish-lilac, with a pale central band.

CYMBIDIUM MASTERSII, *Floral Mag.*, t. 391.—A beautiful form, with racemes of large white flowers with lanceolate segments, and lip spotted with pale red blotches. Mr. B. S. Williams.

CYPRIPEDIUM SEDENI, *Revue Horticole*, December 16, 1879.

DENDROBIUM BIGIBUM, *Floral Mag.*, t. 386. ENCEPHALAROS HILDEBRANDTHI, *Monatsschrift d. Ver. z. Bef. d. Gartenb.*, tab. 1, 1880.

EREMURUS TURKESANICUS, Regel, *Gartenflora*, t. 997.—A noble species, with linear strap-shaped leaves, and fine spikes of densely packed reddish-brown flowers, the segments of which are edged with white.

FRTLILLARIA WALUJEWI, Regel, *Gartenflora*,

tab. 993.—Hardy bulb. Flowers nodding, tubular, campanulate; segments pale lead colour, externally purplish-brown spotted with yellow. Leaves all ending in a fine spirally-twisted point. Alatan Mountains. Dr. Albert Regel.

GRAPE BLACK ALICANTE, *Bulletin d'Arboriculture*, Dec. 1879.—The true variety, large both in bunch and berry.

GRAPES, *Florist*, January.—1, Muscat of Alexandria; 2, Foster's Seedling; 3, Duke of Buccleuch; 4, Dr. Hogg.

THE WINTER OF 1879-80.

TITS has been a winter of trials in this particular locality. The only common evergreens pleasant to look upon were Hollies, Boxes, Rhododendrons, and Laurels. All Aucubas and Sweet Bays will have to shed their black shrivelled leaves—the leaf-linds are pushing and unhurt. There will be no flowers on Laurustinus or Arbutus, and both shrubs will require cutting down, if it be not wiser to start fresh with young plants, which we intend to do with Eucynonus of sorts. Many of these are killed outright, and all too damaged to risk a second bad summer and third severe winter. As we expected, *Griselinia littoralis* succumbed at once in December. Myrtles and *Laurus nobilis angustifolius* on the wall are killed to the ground, and it remains to be seen if they will spring from below. Gum Cistus will die—every week or two another branch gives way. We had not a Snow-drop until late in February, and will again have no Wallflowers or Stocks. A real trial this, not lessened by our having given the Stocks an extra good bed, thus as it turned out insuring their death: but really one can hardly blame oneself for failures when caused by unprecedented seasons. Walking round Edinburgh Castle the other day, I observed the Wallflowers all safe there in the starved nooks among the rocks, and have an idea of sowing seeds about an old wall, and thus making sure of flowers in 1881.

To counterbalance these disappointments all Hellebores have flowered and are flowering extra well, with the exception of *H. argutifolius*, which is killed to the ground; but this week I see symptoms of its breaking from the root, and will leave the woolly stems and leathery foliage to protect it yet awhile. Hellebores seem to have liked the cold wet summer of 1879. The *H. niger maximus* bed was a sight, and being retarded by the storms in December and January was in beauty all February, and—what I never saw before—the honey-bees were working busily about the flowers on February 11. This gives us a faint hope of seed, and we are once again trying if the seemingly well-set pods will produce seed, and have given protection from frost and wet. The spring flowering sorts are all now in flower, with the exception of *H. colchicus*, and make a varied and fine show in the spring border. Last winter they failed entirely, as well as the large-leaved Saxifrages—*Megasea* I see they are now called. *S. ligulata speciosa*, from Mr. Niven of Hull, and *S. ligulata rubra* from Belvoir, are the two earliest, and have been fine. *S. cordifolia* is just coming out, and its variety *purpurea*, which we got years ago from Dr. Lowe, fine dark lilac. A white variety would be a grand addition, even if it faded to pink like *S. Stracheyi*; this last was in flower in the cold frame, and is quite beautiful when it first comes out, pure white with bright red stalks and calyx; I do not know if its leaves ever come good—the poor foliage is its drawback. *Rhododendron dauricum*, *R. præcox*, and *R. præcox superbum*, as well as *Daphne Mezereum*, have flowered beautifully this year. We had not one flower of the sweet *Tussilago fragrans*, although a special bed was prepared, and flowering crowns selected and well done to. We did not wish to be a second winter without the winter Heliotrope, as some call it, and did our best, but it has failed. *Chionodoxa Luciliae* I saw in the Botanic rock garden much stronger than ours in the cold frame, so we shall plant them out, but were afraid to risk the bulbs kindly sent me by Mr. Maw their first year. It is darker and larger out-of-doors. *Leucojum carpatium* is just in perfection, growing beside *L. vernum*, which is long past in seed. I think it is a great advantage to grow this late sort, prolonging the Snowflake as we do the Snowdrop season. The different varieties of *Galanthus* in the Botanic Garden were very marked—small and large, broad and narrow, early and late. *Narcissus* are very late, and I expect

we shall lose one great charm of this family—the way they succeed each other—for they promise to flower all together. *N. minor* is the only one in quantity; *N. obvallaris* used always to be the earliest, but we had lately ten days of bitter east wind and low thermometers (7° to 12° of frost), accompanied by glaring sun—very trying for the spring flowers; even the Saxifrages hung their heavy heads, and young leaves of *Primulas* are whitened and killed.

These two winters and one summer have spoilt our spring beds and borders, and a thorough upturn and change of plan will be requisite. It was impossible to use a fork or hoe in 1879 in our soil; the result of the leave-alone system is a carpet of *Marchantia* and *Hypnum sericeum*: to scrape these pests off does no real good, for the earth is caked below and impervious to air, sun, or rain. So we are longing for our bulb treasures to be up, and get on to our alterations, do away with rings and surfacings, and whatever prevents us loosening the earth between each plant. Looking at our border, the only real advantage of what is called bedding-out struck me forcibly, being the thorough working and justice done to the soil.

While writing the wind has got round to the west, and a skiff or two of rain has made all the difference in the look of the spring flowering plants and shrubs. *Dentaria digitata* is not half enough grown, or appreciated. I observe strangers set it down as a sort of Honesty, forgetting its being in flower six or eight weeks earlier, and merely seeing a lilac Crucifer in bloom. It is a first-rate spring herbaceous plant we consider. Of *Primulas* (rather a heart-break here) the denticulate sorts never fail, possibly from their being almost deciduous, and their long roots are kept cooler in our light soil. *P. kashmiriana* has stood perfectly and is in full flower, also *P. rosea*. *P. capitata* we did not venture out of the frame, but I saw it all right in the Botanic Garden. *Auriculas*, too, from being mulched after the first severe storm, are promising well, while the common single *Primroses*, with the exception of MacNab's red, are dwindled away, as well as hose-in-hose of sorts, and the fine coloured *Polyanthuses*. The laced sorts are lasting better, but then they were seedlings, and I suppose we must just make up our minds to be satisfied with seedlings and give up propagating by division. This is another chronic trial, not merely one of winter 1880, for it is aggravating to raise or get a flower that pleases us, and increase it to a good stock and then off it goes. We used to have beds and edgings of *P. helvetica* and *nivalis* (*helvetica alba*?), and now merely have them; ditto double *Primroses*, eleven sorts; even *Cowslips* disappear.

We have had to take out our hedge of *Rosemary* where backed by the wall, and *Lavender*, and all our *Thyme* edgings—seven sorts, all equally damaged; and our plans have to be altered for this summer, and a fresh stock propagated for winter. We cannot do without *Thymes*. We find *Dog-tooth Violets* do better and increase quicker than any of the other bulbs planted in the grass banks; the leaves are as beautiful as the flowers, and keep much longer fresh and deep marked than when in the borders.

To sum up, we have more deaths to record this winter than last, and sundry herbaceous plants have not as yet appeared, but we are only this week fairly pruning our *Roses* (terribly cut down) and cutting over the herbaceous plants and forking-in our leaf-mould mulching, hoping to be ready for dividing and planting our hardy treasures, still safe in frames, when April weather sets in. *F. J. Hope, Wardie Lodge, March 30.*

FLORA OF THE NEIGHBOURHOOD OF BRISBANE.

VARIOUS recent publications in Australia indicate that botany is gradually becoming a favourite pursuit in that country; and fortunate our Australian cousins are in possessing so early in their history a general Flora of the whole country as a basis for their labours. The Rev. J. E. Tenison-Wood contributes to the last volume of the *Proceedings of the Linnean Society of New South Wales* an enumeration of the flowering plants and Ferns found within a radius of twenty-four miles of the city of Brisbane, preceded by an analysis of the constituents of the flora of the district in question. At present little is known of the range of species in Australia; but exhaustive local lists, like the one under consideration, will afford the required information. With regard to the flora of the Brisbane district, the author says, "We have, both in genera and

species, a certain amount of world-wide forms; and these are for the most part species which are rich in individuals as well. If we were, for instance, to take away the grasses, Ferns, sedges, and rushes from the Brisbane flora, its connection with the flora of other parts of the world would seem to be very slight, but in the absence of such members of the flora the aspect of the country would be a desert indeed. Take them all in all, therefore, our resemblances are greater than our differences, and this must limit our notions of the peculiarities of the Australian flora." This is what one would expect from the position of Brisbane, which is so nearly tropical that the Asiatic element enters largely into the indigenous vegetation. How rich and diversified the flora of Brisbane is may be gathered from the total number of species and the relative number of genera and species. Hitherto 1228 species have been observed, and these are referred to 633 genera, belonging to 123 natural orders. The following orders are the most numerous in species:—

	Species.	Genera.
Leguminosæ .. .. .	115	51
Graminæ .. .. .	99	47
Cyperacæ .. .. .	79	17
Filices .. .. .	63	25
Orchidæ .. .. .	59	31
Compositæ .. .. .	58	41
Myrtacæ .. .. .	53	15
Euphorbiacæ .. .. .	49	24
Liliacæ .. .. .	26	20
Rubiacæ .. .. .	24	15
Rutacæ .. .. .	22	13
Epacridæ .. .. .	21	10
Proteacæ .. .. .	21	11
Totals .. .. .	683	324

Ferns constitute a prominent feature in this flora. None of the species appear to be confined to the district. The proportions of woody and herbaceous species is not given.

*Eucalyptus* is represented by sixteen species, *Acacia* by twenty, *Leucopogon* by eight, *Loranthus* by eight, *Pultenæa* by eight, *Melaleuca* by seven, and *Persoonia* by six. *Panicum* is represented by twenty-one species, and *Andropogon* by seven. *Dendrobium* numbers no fewer than eleven species.

THE MISTLETO ON THE OAK.

It is necessary to my argument that I should show the relation of the Mistleto to the religion of the Druids. In order to do this I must use the *golden key*, of which I have spoken elsewhere, for this was the *aurus ramus* (the "golden branch" of Virgil)\* than which Pliny (xvi. 95) † assures us *the Druids held nothing more sacred*.

In order to understand the mystical secret involved, we must follow with some attention the proceedings of the Druids in gathering this sacred plant.

A recent French writer describes thus the aspect of Gaul, which to a considerable extent must also have been that of Britain in those days ‡:—

"Instead of a cultivated country, it presented to view only an immense forest with thickets almost impenetrable, from the bosom of which arose, like rounded domes, Oaks of secular antiquity.

"Nevertheless, in this immense forest there existed vast openings—the dry lands of Champagne, where the chalky soil would not support abundant vegetation, or the sterile districts of Brittany, where cromlechs and stones unheven by the tool of man's presided over human sacrifices. Here and there were fortified camps, whither the population retired with their cattle."

In Britain vast fortifications encircled the summits of the downs, as we see abundantly from remains still existing.

"The area of Stonehenge (or of Avebury?) was looked upon as a quasi-island in the midst of the expanse of Salisbury Plain. In the north of Gaul the people availed themselves of real islands, and probably of lake dwellings.

"In the depth of these sombre forests the Druids had

\* Virgil, who was born near Mantua, in Cisalpine Gaul, had probably some acquaintance with the tenets of the Druids; at all events, he makes the golden branch, sacred to infernal Juno, the means of gaining access to the infernal regions. (*Æneid*, lib. vi.)

† Nihil habent Druides (ita suos appellant in gos) visco et arbore, in qua gignatur, si modo sit robur, sacratius. Jun per se roborum eligunt lucos, nec ulla sacra sine ea fronde coniciunt, ut inde afflante quaque interpretatione Græci possunt Druides videri. *Æneid*, lib. xvi. 95.

‡ *Le Gai de Cheno et les Druides*. E. Magdaleine, 1877. The writer refers to Deut. xxvii. 5 and 6. "Thou shalt not lift up any iron tool upon them."

their retreats and their principal sanctuaries. They consecrated them to their divinity, and gave the name of God to that *internal something* (*secretum illud*) of which they were naturally cognisant (*qu'ils sentaient par la piété*).\*

"They were forbidden to cut or to lop these sacred forests. They believed them inaccessible to wild animals, impenetrable to the storm, and safe from the lightning. The earth was believed to tremble, and serpents issuing forth from its recesses to coil themselves round the trees. These forests were arsenals. The spoils of their enemies were here deposited under the care of the ministers of religion. These sacred woods were called virgin forests (*castum nemus*), and they formed sanctuaries, the privileges of which were afterwards attached to the churches.

"We see, then, that all was consecrated. They had only to retreat within themselves to be conscious of God, or if their souls 'mingled with the universe' of outward things it was to be conscious everywhere of Divinity.

"But this gave them no peace. It was a religion of fear, and consistent with the grossest immorality. Nevertheless, there was felt a need of reconciliation with this awful mystery above them. It needs be that heaven and earth should in some way be brought together. There was a pure and serene heaven above them if they could share its blessings.

"This meeting-point was found whenever the Oak, itself a symbol of Taronow, the God of Thunder, found a celestial visitant in the *ethereal tree* (*Pren avor*), the *tree of the high summit* (*Uche'var*).

"This tree of pure gold (*Pren pur avor*) could not fix its roots in earth,† it must be altogether of heavenly original; and so to find a congenial home on earth it rooted itself into that which was already of congenial nature, the dread Taronow, the mystic Oak.

"So it was not common Mistleto that would answer the purpose, but it was the *Mistleto upon the Oak*, a conjunction even then rare, and now almost extinct. It was the great object of the Druids to ascertain when this heavenly gift had been given, and to prepare themselves for its reception by fasting and special ceremonies.

As soon as the discovery was made it was the sign of a communication from heaven (*e caelo missum putant*), and the announcement was made to the Pontiff of one of the three great colleges (of Gaul).

"The next business was to arrange for the collection of the precious plant, and bards were sent forth in all directions to summon the people to the great religious ceremony. The words of the proclamation are believed to survive in the custom which prevails, especially at Chartres, the old metropolis of the Druids, in soliciting presents on the new year with the words, '*Au gui l'an neuf*.'

"The tribes being assembled, with tumultuous joy, at the appointed spot, waited for the clergy, who arrived by torchlight leading the sacrifices. Three Druids of the first class, crowned with Ivy, advanced with slow steps, one carrying the bread intended for offering, the next a vase filled with holy water, and the third a sceptre of ivory, the characteristic mark of the chief Druid.

"The pontiff who was to gather the sacred plant then advanced to immolate the victims and offer the sacrifice. He was dressed in a white robe and a rochet, carrying an ornament somewhat similar to a cross, which was also the custom of the priests of Egypt. He was shod with wooden sandals, crowned with Oak leaves, and wearing a long beard which gave to his countenance a character of mysterious austerity. From his girdle was suspended, by a chain of precious metal, a pruning-knife of gold, having the form of a crescent. Behind the chief priest came the nobility, and then the people.

"When all had arrived at the foot of the Oak three ceremonies had to take place: (1), the offering of the victims and the consecration of the Oak; (2), the gathering of the Mistleto; (3), the distribution of the sacred plant, the sacrifice, and the festivities.

"A triangular altar of wood was constructed round the trunk of the tree (*unity in the circle, and trinity in the altar*), from which the Oak seemed to arise.

"A circular tablet was appended to the tree, on which were written mystic letters signifying (according to Trémolière) *Dieu père, Lumière souveraine, princeps de la vie qu'il donne au monde*.

"The victims, two bulls, were then offered, and a Druid cast upon a fire lighted at each of the angles of the altar a slice of bread on which some drops of wine had been poured, hymns to Tentates accompanying this portion of the ceremony.

"These offerings being completed, the Arch-Druid ascended the tree by means of a ladder, and cut, without touching it, the branch of Mistleto with his golden falchion, allowing it to fall upon a white linen cloth which had never been used, the four corners of which were each held by young Druidesses or by Druid dignitaries. Great care was taken that it should not touch the ground.

"Afterwards took place the distribution of the precious plant. Water in which the sacred Mistleto had been immersed was given to or sprinkled upon the people (*l'œm lustralis*). Then the branches were cut to pieces and divided amongst the assembled tribes in the midst of feasts and addresses."‡ *J. E. Howard, F.R.S.*

‡ The "Paradise of St. Ann" (to which I have seen the Bretons flocking in their picturesque costumes), may well be a "survival" of the above festival of heathenism.

## TSUGA PATTONIANA.

THE last time this species of Hemlock Spruce was brought before the readers of the *Gardeners' Chronicle* was by Dr. Engelmann at p. 756 on December 13, 1879.

Knowing that Dr. Engelmann was about to publish descriptions of the Californian Conifers, I had been looking forward with no small degree of interest to see how he would treat this species, and much as other writers had misjudged and confounded it with other species, I had great faith that Dr. Engelmann would settle all doubts about it; and although he has not done this in an elaborate manner, nevertheless I am not altogether disappointed.

His description of the plant, together with reference to authorities for name and synonyms, would no doubt surprise many cultivators of the species of American Hemlock Spruce, as under the above name he very faithfully describes the characters of a truly

and at the same time suggested that it should be named *A. Pattoniana*." Shortly after receiving this consignment, the committee of the Oregon Botanical Association described and figured the species as *A. Pattoniana* in a circular which they distributed to the Association in 1852. That was, I need hardly repeat, the first time that it was figured and described, and that, too, from Mr. Jeffrey's second batch of specimens, as indeed we gather from the said circular itself. So that really Mr. Jeffrey's *Abies* No. 430 is the true *Tsuga Pattoniana*, and if it is identical in its specific characters with the one, specimens of which he sent home from the Mount Baker range, lat. 49° N., then he had his original wish gratified; but it is extremely doubtful about its being the same. In the circular already mentioned a brief description of the plant is given, but as it might as well apply to other species it must go for very little. But on plate iv. engravings of the cone and leaves are given, and from appearances they agree with the characters of the *A. Hookeriana*,

FIG. 79.—FORELLE PEAR. (SEE P. 464.)

Californian plant, best known in Britain as the *Abies Hookeriana* of A. Murray.

Having myself been compelled to adopt the view taken by Dr. Engelmann, I beg leave to assign the reasons which led to it, and to do so it is necessary that I should begin at the beginning.

In 1851 Mr. Jeffrey, collector for the Edinburgh Oregon Botanical Association, sent home in case No. 13 cones and seeds of a species of *Tsuga* which he had found on the Mount Baker range in lat. 49° N., and requested of the Association that the plant might be named in honour of Mr. Patton, one of the members. The name *Abies Pattoniana* may have been sanctioned by the committee of the Association, but the species, as such, never was described by them from the said consignment of specimens. Seedlings, however, are said to have been raised from it, and are now well known in Britain.

In 1852 Mr. Jeffrey sent another supply of Spruce cones and seeds, accompanied by the following note:—" *Abies*, No. 430.—Collected October 15, 1852; lat. 42°, elevation 6000 feet, Cascade Mountains.—I forwarded seeds and cones of this species in case No. 3 from Mount Baker range, in lat. 49°

Murray, *Edin. New Phil. Journal*, 1855. The leaves particularly agree with those of Mr. Murray's plant, and fully justify Dr. Engelmann's description of them, under the name *Tsuga Pattoniana*, as being "6—12 lines long, angular, acutish, attenuate at the base, often curved." I have critically examined Jeffrey's *Abies* No. 430, in the museum of the Edinburgh Botanic Garden, and can testify to it being specifically identical with *A. Hookeriana*, Murray. I may here be allowed to state that the reason why Mr. Murray so long and strenuously contended for the specific distinction of his *A. Hookeriana* from that of *A. Pattoniana* was due to the impression which he had, as revealed in his *Synonymy of Various Conifers*, that *A. Pattoniana* was originally described and figured from Jeffrey's specimens from the Mount Baker range, lat. 49° N.; and further, it was always with these specimens, together with the seedlings raised from them, that he compared his *A. Hookeriana*.

It will be seen that I have thus far endeavoured to support Dr. Engelmann in the characters which he assigns to *T. Pattoniana*, but here I must stop. In his list of synonyms he gives *Pinus Pattoniana*, Parlatore, in *DC. Prodromus*, in full. Now it is well

known that Professor Parlato included under that name the species represented by Mr. Jeffrey's specimens from both the 42° and 49° of latitude; and though he believed that they represented one species, yet his specific description pretty well covers the characters of both. Are we then to understand that Dr. Engelmann follows Prof. Parlato in the belief that these forms are of one species? It seems doubtful as to what he means, but at any rate in his description of *T. Pattoniana* he has only described one of the forms. The other, namely, the Mount Baker plant collected by Jeffrey, has been so well described by Dr. MacNab—who by the way also fell into the error of supposing it to be the true *Pattoniana*—that I cannot do better than quote his description in full:—"Leaves six to nine lines long, irregularly bifarious; margin denticulate near the obtuse apex; upper side yellowish-green with from two to four rows of stomata on each side of the slightly marked central furrow, beneath with six to seven rows of stomata on each side of the middle line." Compare the foregoing particulars with Dr. Engelmann's description of *T. Pattoniana* already given. The cone comes exceedingly near to that of

tion, who, some time between the years 1863 and 1866, sent home specimens which were provisionally named *Abies Hanburyana* and *A. Parryana* (not the true Spruce now being cultivated in Britain under this name), but which have since turned out to be identical with Jeffrey's plant from the 49° of latitude. So that in addition to Mr. Jeffrey's original specimens of this species those of Mr. Brown can be examined in the herbarium of the Edinburgh Botanic Gardens. This species may have again been found, and seeds of it sent to Britain since 1866, but I think I may safely say that seedlings of it have not been advertised or offered for sale.

The natural position of this species is between *T. Mertensiana*, Carrière, and *T. Pattoniana*, Engl., but comes much nearer to the latter than to the former. And although there is the possibility of intermediate forms being yet found somewhere in the extensive and as yet imperfectly botanised region of the Cascade range to link it and *T. Pattoniana* together, yet until then, as species are now founded, they must be considered distinct; and as the plant from the Mount Baker range has heretofore borne an ille-

### The Poultry Yard.

**GENDER OF HENS' EGGS.**—Clever stupid people are always asking foolish questions about things that no one can give positive or reasonable answers to, and equally clever stupid people are always ready to give their replies, which are never of the slightest value. This question, as to the probable gender of eggs, is one respecting which some persons are always wanting to obtain unreasonable information; and, in response to one such querist, this is a sample reply:—"Hold an egg up to the candlelight; if the air-space is seen at the top, in the broad end, it will produce a cock bird; if a little on one side, it will be a hen."

Now this is intolerably stupid, because there can be no possible connection between the position of the air-chamber and the sex of the unincubated chick. Any such divergence in the air-chamber is but the result of some accident, whilst the rule is to find it exactly at the top of the egg. That eminent naturalist, Professor Owen, gives us some interesting information upon the structure of the egg, showing that whilst the air-chamber remains in the same position in the egg until the newly-hatched chick exhausts the air for its own purpose, the position of the yolk is a changing one, as, whatever be the position in which the egg is placed, the generative orbital portion always comes uppermost, and is in that respect as infallible in its action as the needle is to the magnetic pole. This is a wise order of Nature, because the result is to bring the yolk, and specially the most vitally organic portion, or top of it, to the surface. And as in the nest eggs invariably lie on the side, the warmth of the sitting hen comes in immediate contact with the life-germ, and natural incubation proceeds. In all this, however, there is no allusion to, or connection with sex; indeed, sexual characteristics in the fowl are not apparent until some time has elapsed. It might be some advantage to know beforehand what will be the sex of the coming chicks, but unless any one is endowed with second-sight means of telling are quite out of the question; and therefore the less seldom such queries are put the better for the propounder's reputation. *A. D.*

### Florists' Flowers.

**THE AURICULA AND OTHER FLOWERS.**—The great progress made by Auriculas during the last week or two reminds us that the exhibitions are near at hand. The exhibition to be held at South Kensington on April 20 promises to be the best exhibition of Auriculas ever held in England. Besides an increase in the classes over that of previous years, there will also be a series of prizes offered for seedlings in all the classes; and by the accounts received from the northern districts it seems that the number of high-class seedlings likely to be exhibited is very large indeed. Mr. Woodhead, a very enthusiastic cultivator, will flower one thousand seedlings from good crosses; and I hear that his plants are very forward this year, and will most likely be in time for the exhibitions. The Rev. F. D. Hooper, and Mr. Benjamin Simonite, have exhibited such good seedlings in past years that we look forward to seeing yet better things this season. From Wales there will probably be more than one competitor, and Mr. Llewellyn is not likely to be in the background with high-class seedlings. From Lancashire I do not hear much; but that county, celebrated for Auriculas, is not likely to be behind, and the silence may be ominous. To the Auricula fancier the raising of seedlings creates a more intense interest in the plants; and if the best varieties are chosen to be crossed for seeding from, there is certain to be two or three first-rate varieties in every thousand.

For the last few years it has been very difficult to bring forward the best varieties in cold frames. Owing to the genial weather there has been no difficulty this year, and I have not as yet thought it desirable to place the plants in the house. Even Mr. Woodhead, in the highest and coldest district of Yorkshire, fancies that some of his best flowers will be over before the date of the Manchester exhibition.

In the report issued by the committee of the Southern section of the National Florists' Societies, it is stated that one object of the exhibitions is to demonstrate the peculiar adaptability of the Auricula, the Carnation, and Picotee, to the circumstances of the residents in or near large towns and cities. On one occasion I paid a visit of inspection to the col-

FIG. 80.—FLEMISH BEAUTY PEAR. (SEE P. 464.)

*T. Pattoniana*, but to set against this I find a very great difference in their barks. If we examine a plant of each kind, say from fifteen to twenty years old, growing under exactly similar conditions, we shall find that the bark of *T. Pattoniana*, or the kind lately described as such by Dr. Engelmann, is, from the decaying leaves on the branches and trunk down to the surface of the ground, smooth and of a whitish or light grey colour, or if broken at all is on the trunk near the base in large rounded thick flakes. The bark of the other, from the base of the trunk up to the decaying leaves, is on the contrary dusky, almost black, and regularly broken up into thin shreddy pellicles as though the trunk were furrowed. So great is this difference in the barks of the two trees that, even if they could not be distinguished by other characters, it is sufficient to for ever separate them as distinct and good species. The plant from the Mount Baker range is, as one would naturally suppose, the hardier of the two; the late autumn growth of the other is liable to injury by early frosts. Nevertheless both are hardy enough in any part of Britain.

The British Columbian species was also re-discovered by Mr. Robert Brown, while acting in the interests of the Oregon Botanical Associa-

tion, and since the *A. Hookeriana* of A. Murray has been found to be synonymous with *T. Pattoniana*, to prevent further confusion by the introduction of a new name I would suggest that in the future it may be known as *Tsuga Hookeriana*, in honour this time of Sir Joseph Dalton Hooker. But should this description of the plant as herein given be considered too imperfect to warrant this or any other name, I still trust that, in the interest of simple science, my suggestion may not be lost on the one who may legitimately name it.

To the fact of this species and *T. Pattoniana* being little known, or only known by a few, and to their decided merit as ornamental trees (and as such deserving of extensive cultivation), I attribute my hope of being excused for these rather lengthy notes. *George Syme, Castleton Botanic Gardens, Jamaica.*

**MACKAYA BELLA.**—We are glad to note the fact, for the encouragement of those who have not succeeded in flowering this lovely plant, of which we gave an illustration in May last, that it is now in bloom in the gardens of J. E. Wilson, Esq., at Edgbaston, Birmingham. We have a spray before us, kindly sent by a correspondent, but no details as to the mode of culture adopted,

lection of the Rev. F. D. Horner, Kirkby Malzeard, at the blooming season, and went on the next day to Sheffield to see Mr. Simonite's collection; and I must say that the plants, well within the range of Sheffield smoke and its sulphurous atmosphere, were as healthy as those in the clear atmosphere of Kirkby Malzeard. It is the same with the Carnation and Picotee. Mr. Simonite has carried off the principal prizes at the National exhibitions at Manchester on more than one occasion. Mr. Dodwell's garden at Clapham is quite within the London atmosphere, and nowhere is there to be seen a healthier collection of plants than he has. Last year they were superior to our own in the clearer atmosphere of South Essex, and quite as good as Mr. Turner's in the still more favourable conditions to be found at Slough.

Since writing the above remarks, I have received reports from several amateurs in the South, and their belief is the same as my own—that the best flowers will be over before the date of the show on the 20th. Laced Polyanthus usually flower earlier than the Auriculas, and we cannot expect that they will be at their best. Our common Primroses are mostly over; and by no manner of scheming can the bulk of them be kept back a week longer. The same may be said of the species, especially the Himalayan section. We hope to have some of all the above from the North and Midland Counties, as they are from one to two weeks behind us. *J. Douglas, Leyford.*

## VEGETABLE PRODUCTS OF SHANTUNG.

In a report on the products of Shantung it is stated that besides the fruits usually cultivated in China, Strawberries have been introduced by Europeans, and are found to thrive well; though the natives have not taken to their cultivation. Raspberries grow wild all over the hills, but have not been admitted into the orchards, owing, it is stated, to the native ignorance of horticulture generally, and of grafting in particular. The only fruits of good quality are Walnuts, Grapes, Plums, and Melons. Millet is grown on a large scale, and is of two kinds. Siao-Ku Millet is entirely consumed locally, its stalks, now that the Wheat-straw is manufactured into braid, is the winter mainstay for feeding beasts of burden and plough-oxen. The larger Millet, Kaoling, being largely composed of heat-giving oil, affords a cheap diet to the poorer population; it is also distilled into an inexpensive spirit containing a large proportion of alcohol. Its stalks are of the highest value, and supply the place that Bamboos fill in the South. They form the fences of gardens and fields; they are universally used as laths in the roofs of buildings, both native and foreign, and of the rude but effective native hothouses for rearing winter Cabbages and preserving delicate plants. They are likewise the principal fuel used for cooking and for warming the brick couches on which, as well as in the east of Russia, natives live and sleep during the cold months. No Millet is exported.

Of all the exports of the country that of straw-braid is in the most flourishing condition; being grown in the Lai-chow department, Chefoo is the natural port of its exportation. Increasing steadily every year, it will probably soon be the mainstay of the export trade of this port. The export of straw-braid, which in 1873 was only 1,363,054 lb., had increased in 1877 to 2,730,606 lb., and in 1878 to 3,736,268 lb.—value, £231,181; besides which 42,296 straw hats, of the value of £1057, were exported. Vermicelli, it is said, is made in large quantities, and its production has increased, *pari passu*, with that of straw-braid. In the immediate neighbourhood of Chefoo an extensive manufacture is carried on—masses of it glistening white in the sun as it hangs up to dry form a marked and not unpleasing feature in the autumn. The Shantung Cabbage forms an important item in the food of the population. The stunted grass of the hills does not even suffice for fodder for the beasts of burden and the few plough-oxen, consequently there is but little pasture for sheep and cattle. The eating of beef is forbidden by the Buddhist religion, is denounced by tracts spread abroad by benevolent societies, and is in times of distress vigorously punished by the secular arm; mutton and goats' flesh are luxuries that few can afford to indulge in, and though pigs and poultry are reared to a great extent by the peasantry, they are only eaten

during festivals. To supply the place of meat the natives indulge in highly-flavoured fish and seaweed, in small quantities, and in dried Shantung Cabbage; the stalks, containing more nourishment than the leaves, are preferred. These vegetables are reared in winter in rude hothouses; each Cabbage has a small hut over it, the roof of which, made of the invaluable "Kaoling," or Millet stalks, is covered by about 6 inches of earth; each hut has a doorway to the south, made of paper, which is carefully opened on warm, and closed on cold days. No spot on earth is more bountifully supplied by Nature with all that renders a country rich and prosperous than Shantung; the soil, naturally fertile, instead of being, as is the case, periodically parched by droughts, would be regularly visited by rains and snows were it not that the hills, which might be covered with moisture-producing trees, are bare and barren, every atom of wood, except that in the neighbourhood of temples and a few orchard trees, being ruthlessly cut for fuel as soon as it grows.

## Garden Operations.

### KITCHEN GARDEN.

**CULINARY HERBS.**—The quantity of certain kinds of herbs which is consumed in the culinary department of an ordinary establishment in the course of a year would scarcely be credited by any one not practically acquainted with the demand, which in the case of some subjects, such as common and Lemon Thyme, winter Savory, and Marjoram, Sage, Mint, Tarragon, and Parsley, is not of an occasional character, but almost of daily occurrence. The frequent plucking to which the plants are thus made liable, in course of time so debilitates and shortens their existence as to necessitate provision being made in the way of new plants every year. For this purpose April is unquestionably the best period in the whole year. In a class of subjects so diverse in nature and requirements as these, which include both hardy and tender annuals, as well as biennials and perennials, the mode of propagation and the process of cultivation necessarily will vary considerably. In the case of hard Thyme, winter Savory, and Sage, we make a rule of sowing a small quantity of seed in a pan or box every year at this time, and when the seedling plants are fit to handle we prick out as many of them as we are likely to require either under similar conditions or in a cold frame, where they remain until such time as they are ready to be put out in the places selected for their permanent quarters. We also prefer to raise Hyssop and Fennel by the same means and under similar conditions, and Borage and Chervil likewise, but these should be done in a natural way out-of-doors. The latter subject should be sown now, and again in the autumn; by so doing a supply will be insured throughout the year. Tender annual kinds, as Sweet and Bush Basil, Knotted Marjoram and Summer Savory, require to be raised in pans or boxes in heat; these subjects can be grown more efficiently under glass than otherwise, and therefore the ordinary supply for drying purposes should be cultivated at those times when the glass conveniences can be best spared for the purpose.

At many places Basil is required to be had in a green state the greater part of the year; for this end occasional sowings should be made, and the plants grown in houses or pits suitable for it. Parsley, as a matter of course, comes in the herb class, sowings of which should be made periodically to meet the requirements. Mint, Tarragon, Pennyroyal, Marjoram, and Lemon Thyme are readily increased by means of dividing the roots, which when effected can be planted in the appointed places at once. Tarragon roots are wanted for forcing; an additional supply of these, to meet this demand, will therefore be necessary, and this likewise will be the case in regard to Mint. This subject delights in the richest kind of soil, and for the purpose of having it out-of-doors as early as possible a warm sheltered place should be given up to it. The growth in plants which are intended to be forced the following season should be allowed to proceed and develop itself unchecked. The most marked point to be observed in the cultivation of herbs is to give them a sunny position, and soil of a somewhat friable and rich nature; while that of gritty character will be most suitable for the hard-wooded section of these plants.

Ordinary work of every description will increase by the force of favourable influences, such as we are providentially now experiencing. Asparagus plants are now about fit for removing from seed-beds to more permanent places. We fully described in a recent paper under this head the best method of planting this important vegetable. The main crop of Potatos should also be got in without much further delay. We are still of the opinion that whole sets of moderate size are preferable to any others. In planting the distance apart of both rows and sets is a matter which must

be properly determined by those having a knowledge of the state of the soil. In highly enriched kitchen gardens, 3 feet apart between the rows and 15 inches apart in them is about a fair average distance, and in poor soil 21 inches by 9 inches in the row will suffice. Early planted ones will be coming through the soil soon, and a little litter thrown loosely over the top will make them safe from ordinary frosts and will be of material help in advancing the crop of tubers. Lettuce plants which have been forwarded in frames, after being hardened, should be planted out. At some places the garden is so limited in extent as to necessitate very close cropping being carried out; under these circumstances the spaces between all such subjects as Scarlet Runners, French Beans, Peas, &c., must necessarily be made available, and will be convenient places for rows of Cauliflower, Cabbage, Spinach, Lettuce, and similar plants. Make a sowing of Osborn's forcing French Beans or some other kind about the middle of the month on a warm sheltered border, and supplement it by another sowing of Canadian Wonder in about a fortnight hence. Neglect not to sow Peas as required to come in, and to keep up a constant supply when advanced crops of these become exhausted. Where sticks are to be used let them be put in in an upright position, so as to allow the vines space to climb up inside them. Sow the main crop of Beet in good soil, in rows 15 inches apart. Henderson's Pine-apple, or improved forms of it, is equal if not superior to any other kinds. Choose suitable opportunities, as, for instance, when sunless and showery weather prevails. Let all planting operations, as far as possible, be done expeditiously. On the other hand, under the influence of favourable conditions, such operations as hoeing, stirring the surface-soil, and clearing, should be accomplished promptly. Remove exhausted stems of Brussels Sprouts and other winter stuff immediately they are done with, for the sake of appearance, and to benefit the soil.

**FORCING DEPARTMENT.**—French Beans.—These plants are so subject to the red-spider that the cultivation of them along with fruit trees in houses should, as far as possible, be discontinued altogether, and confined to pits; the surface soil about the plants should be well mulched with manure, in order to keep them equally moist and save time in watering.

**Potatos.**—Those which were planted out at about the beginning of this year will be fit for lifting; this should be done off-hand, and the Potatos stored for use. We divide the lot into 1 lb. and 2 lb. samples in pots, and place soil beneath and above them; the pit thereby is available for other purposes. The force of sun and heat combined will necessitate more attention being given to watering later crops of these. This also will apply to other crops placed under similar conditions, as Carrots, Radishes, Peas, &c.

If not already done, sow Gherkin and Ridge Cucumber seeds for out-of-door work, also Tomato, Vegetable Marrow, Capsicum, and Chili seeds, and shift on advanced plants of these as they require it. Prick out on to a gentle hotbed enough Celery plants to form the early crop, and sow again now for a subsequent one. Tomato plants coming into bearing will need a mulching of about 3 inches of lumpy loam and manure over the surface soil when it becomes permeated with roots. As soon as the fruit shows signs of colouring let it be kept dry, or in the case of tender-skinned sorts the surface will be disfigured by cracking. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**PINES.**—Seasonable influences, such as may now be expected to prevail in the way of sunshine and heat, will materially conduce to the advancement and well-being of every class of plants in this department, providing these means conformably with those of an artificial character also, be utilised in a proper manner, by making solar heat as far as practicable subserviently useful in lieu of fire-heat. A free course of growth will now be proceeding in every plant if its health is satisfactory; see, therefore, that every detail in management is strictly enforced. Watering, which is the most important operation of all, should be seen to regularly at least once in every week; each individual plant should be examined by the hand before water is given to it. Syringing overhead now may be much more freely indulged in at the time of closing up the place for the day, and an abundance of moisture should abound in the house constantly when it is shut up. Be very careful in disturbing fermenting beds which have a moderate degree of heat in them, lest by so doing it become increased to an extent that will be injurious to the roots of the plants. The temperature in fruiting houses should range from 80° to 95° by day, at about 70° or 75° at night; that of successional plants at 65° to 70° by night, and 80° to 90° in the day; and the younger stock of plants will take no harm at 65° at night, and a proportionate rise in the daytime

according to external influences. Plants which are placed near to large squares of glass will be much benefited by having a slight shade placed over them during the hottest part of sunny days until such time as the tissues of the leaves have become more inured to the effects of sunshine. Look over fruiting plants occasionally, and remove all surplus suckers which are not wanted for stock, and see to the staking of any fruits which are not in an erect position. *G. T. Miles, Wycombe Abbey.*

## FIGS.

When the fruit on the early pot-trees show signs of changing for ripening the ventilation may be increased whenever more air can be admitted without causing a check, and the flavour will be greatly improved by full exposure to the sun. Many of the Figs on large pot-trees cannot have this advantage, but judicious thinning, stopping, and tying will throw them open to light and air, two necessary elements at all times, as Figs ripened in a close, moist pit or house are perhaps the most insipid fruit imaginable, while properly managed trees yield an invaluable addition to the dessert at a time when choice fruit is by no means plentiful. The Fig is a gross feeder, and enjoys good food when in full growth, more particularly when the pots cannot be conveniently arranged for the active roots to draw nourishment from the decaying leaves, generally used as a plunging medium. When grown under glass it is subject to two troublesome insects—red-spider and brown-scale. The first does not make much progress under good syringing, but when atmospheric moisture is reduced it advances rapidly, and on this account great efforts should be made to keep the foliage quite clean up to this period. Brown scale, if left undisturbed, soon spreads over the young shoots, and extends to the leaves and fruit, when its destruction is attended with some difficulty; but if taken in time a solution of Gishurst, carefully applied, will prevent it from doing much mischief. Water to the roots through all stages is necessary, and favourable opportunities for well washing the trees and all out-of-the-way corners may often be secured through the ripening season by gathering all the ripe fruit at one time. For private use Figs should be ripe when taken from the trees, but for market purposes they may be gathered before they attain that state. The night temperature may now range from 60° to 65° with a little air, and 80° to 85° by day. Open the top ventilators at 70°, and admit a circulation of air at 80°, with plenty of moisture rising from water applied to the mulching and all available surfaces.

The permanent trees in succession-houses, usually planted in internal borders, will now take large quantities of water through the mulching, which should be kept constantly moist as a means of increasing their vigour and keeping insects in check. Syringe twice a day, and let the temperature range 5° lower than that recommended for the early house. Trees in cold houses and wall cases should now be tied or nailed in, and syringed on fine days. Excellent crops of fruit may be grown in these structures in low, cold situations unfavourable to their culture against walls; but to insure annual success there should be some provision for keeping out frost in the spring and ripening the wood in the autumn. Firing through the winter is unnecessary, possibly injurious, as the trees may be unfasted in the autumn, tied in bundles, and protected with dry straw or bracken. *W. Coleman, Eastnor.*

## ORCHARD-HOUSE.

The trees in pots from this date require considerable attention. They must not have too much water, and it would almost be as bad to give them too little, and those who have charge of the trees will not be highly successful unless they patiently study the requirements of their trees. I find they do very well with the top-dressing that was recommended at the usual time for performing this operation, but, as I have stated in a previous number, it is very difficult to ascertain the state of the roots as regards moisture owing to the top-dressing becoming moist and drying but slowly, while the portion of the soil which is quite full of roots becomes over-dry before it can be noticed and the trees suffer for want of water while to all appearance the potting material is too moist. I prefer in most cases to repot the trees very soon after the fruit has been gathered, and this can be done with advantage even if it is not desirable to repot into larger pots than those in which the trees had been previously growing. It has been stated how this had been done, and it would only be repetition to explain it again. There is no difficulty to water such trees, and no one with even a superficial knowledge of gardening would be likely to make a mistake. Our trees have been fumigated once or twice, but there is still a number of the aphid tribe to be seen on the leaves, and now, as the blossoms have mostly faded, it will be a good time to fumigate. This pest spreads on the Peach and Nectarine trees with amazing rapidity, and the leaves curl at once. I cannot too strongly urge the importance of destroying

it as soon as it is discovered, and it would be better if it could be kept quite at bay. We seldom realise the mischief that is occasioned by allowing greenly to feast on the juices of certain classes of plants, or we would destroy it as soon as the least signs of its presence appeared. It would be very desirable now to thoroughly syringe the trees, to clear them from decaying petals; the syringing also incommodes the greenly, and a regular system of it quite disposes of the red-spider, and this pest will speedily appear as the days become warmer, and there is much more danger of this if the house is crowded with plants, or if the shelves are devoted to Strawberry culture. It must also be noted that the Strawberry plants are now throwing up their flower trusses, and have made considerable growth, so that it has been necessary to thin out the plants considerably, to allow of the perfect development of the leaves. Now that the trusses are rising, weak manure-water must be given to them at each alternate watering. Syringe under the leaves once or even twice daily in fine weather. *J. Douglas, Loxford.*

## ORANGE-HOUSE.

The trees here also require much attention, they are now making considerable progress, and require plenty of water. It is better to surface-dress with a compost of crushed bones, rotten manure and loam, than it is to water with diluted manure-water. Insect pests increase more rapidly now than they do at any other season, and a constant watch must be kept to prevent their making any progress. Keeping the trees in a healthy growing atmosphere and well syringed tends to maintain them in health and checks the increase of insect pests. The night temperature may range from 65° to 70° with an increase of 10° by day. It is a very good plan to place the trees over a dung or tan-bed, not plunging the pots into it, and the fermentation may be kept up by turning the bed at intervals of a month or six weeks, and adding a small portion of fresh materials. *J. Douglas, Loxford.*

## PLANT HOUSES.

ORCHIDS.—The month of April, with its proverbial sudden changes of sunshine and showers, is without doubt a troublesome period to all who have the management of a collection of Orchids. On many an April day the changes are so numerous between sunshine, shade, heat, and cold, that to keep the atmosphere of hothouses anything like regular in temperature is next to impossible. For several mornings we have found it necessary to use in every division, save the cool-house, a considerable amount of fire-heat, in order to maintain the proper day temperatures. Even through the middle of the day the pipes have been kept warm, so that when the sun becomes suddenly obscured by heavy clouds we can, by closing the ventilators, avoid any extreme fall in the temperature. The blinds will, of course, require a great deal of looking after, but there is not the least need to keep working them for every trifling change in the weather. Keep them down on all very changeable days, and up whenever scorching of the foliage is not feared. At this particular time of the year scorching of the foliage takes place in much less time than many persons might think. I have here and also in various other collections seen plants marked for years through having been exposed for a short time to the full glare of a spring-day's sun. Through the summer, probably owing to the free use of the ventilators, one seldom gets an Orchid scorched, while during the ripening days of autumn many are greatly benefited by a fair share of sunshine. Now is the critical time, and, judging from the past, more mischief is likely to ensue from too much sun than too much shade.

A sharp look-out must now be kept with respect to such insect pests as aphides and thrips; both are deadly enemies to Orchids, living as they do upon the vital fluids of the plant. Many a rare delicate plant will flourish fairly well under cultivation if kept clean, but speedily succumbs under even a slight attack of these parasites. Take, for instance, *Odontoglossum Warscewiczii*: this plant will grow very well under the same conditions as *O. vexillarium* so long as it is free from insects, but from the moment a single yellow thrips takes possession of its young breaks the balance of its existence is upset, and a rapid decline in vigour follows, which can only be arrested by frequent and careful cleanings. Black thrips are not so difficult to keep under as the yellow, but they must be allowed no quarter. Nothing less than sponging the under-side of the leaves of plants attacked by this pest will entirely eradicate it. Tobacco smoke will kill every form of the insect with the exception of the eggs, but these, sealed down as they are by the excrement of the matured insect, can only be got rid of by the sponge dipped in some weak insecticide. Neither the green or yellow fly are so injurious to the plants as the thrips, but they mar the freshness and purity of every flower they attack, and when clustered on the young breaks of such plants as *Dendrobiums* do undoubtedly

prevent such from attaining the perfection they otherwise would. The remedy for the four named insects is tobacco smoke. If the insects are in the cool-house, among such plants as *Odontoglossums* and *Masdevallias*, fumigate lightly and frequently, for the foliage of these cannot stand strong doses of tobacco smoke. In either of the other divisions fill the house with smoke on two consecutive evenings, or on the evening of one day and morning of the next. Previous to smoking get the houses nicely dried up, as the plants suffer less from dry smoke than from moist. The following plants—*Bolleas*, *Pescatorcas*, *Odontoglossum Phalenopsis*, *O. citrosum*, *Ceologynes*, and the Brazilian *Oncidium*s of the crispum type, suffer more from smoke than any other Orchids. Use the fumigator so that these get only a mild dose. White scale and mealy-bug are two pests that annually cause hundreds of cultivated Orchids to decline in vigour; to keep these down the brush and sponge must be often in use. As a preventive to red-spider the flow-pipes in all the warm divisions should be smeared over here and there with some sulphur paint. This is best made by mixing first equal parts of dry earth and sulphur together; then stir in sufficient water to give it the consistency of thick paint. Apply it after the houses are closed for the night. In the cool-house, with the exception of *Lycastes*, few plants suffer from red-spider. These suffer from a small species of that pest, and I believe this to be the principal cause why they are so often seen in a languishing state. Clean or unclean these plants should have their foliage washed over once a month. As these *Lycastes* go out of flower, let such as require potting be done at once. They do perfectly well in a mixture of peat and sphagnum well drained, and although moisture-loving plants the young breaks easily rot if the plants are potted too low. *J. C. Spyers, Burford Lodge, Dorking.*

## TOWN GARDENING.

LAWNS AND SHRUBBERIES.—After three weeks of fine bright weather and a few refreshing showers, the garden is beginning to look as if there was some life left in it after such a severe winter. The grass is growing rapidly, the shrubs are bursting their buds, *Lilium candidum* is pushing forth its stems, and the garden will soon be clothed in its proper robe of verdure. The roller will have to be actively employed until the mowing commences, when the mowing machine takes over the mowing and rolling to itself. The edges of walks should be neatly cut. Shrubberies should have the hoe run through them at the first opportunity.

BEDS AND BORDERS.—We may now fairly consider that the bedding-out season has commenced with the planting of edging plants. The first thing to be done is to have the edge set up as directed at p. 207. When such plants as *Cerastium*, *Veronica*, *Santolina*, *Stellaria*, &c., are used, it is essential that the soil should be pressed firmly round the roots, to prevent too much drought or wet getting to them. Hardy annuals should now be sown on borders; the ground was never in better condition than at the present time. Amongst the following may be found some of the best:—*Clarkia elegans*, *Collinsia bicolor*, *C. violacea*, *Silene pendula compacta*, *Godetia Lady Albemarle*, *G. Whitneyi*, *Calliopsis*, *Eschscholtzia*, *Lupinus*, *Nemophila*, *Papaver*, *Saponaria calabrica*; also ornamental grasses, *Agrostis nebulosa*, *A. pulchella*, *Briza maxima*, *B. elegans*, *Eragrostis elegans*, *Lagurus ovatus*, and *Stipa pennata*. In sowing annuals on borders the special things to be studied are their heights and colours, arranging them in their position on the border accordingly. It is a good plan to sow them in a circle 18 inches in diameter or three circles connected, forming a figure similar to a Shamrock leaf. These circles, or figures, should be placed at irregular distances along the border, leaving a good space between them to fill in with tender annuals or bedding plants when the season arrives.

PROPAGATING DEPARTMENT.—*Alternanthera*s should now be propagated, and where there has been a good stock kept through the winter there will be no difficulty in making up the required quantities. *Mesembryanthemum cordifolium variegatum*, *Koniga variegata*, *Gnaphalium lanatum*, *Iresine Lindenii*, *I. Herbstii*, *Coleus* of sorts, *Heliotropes*, *Nierembergia gracilis*, &c., should now be ready to pot off, if not already done. *Mentha Pulegium gibraltarium* should be parted up and planted in boxes or frames; it will not do without protection in town before May. Golden Feather should now be pricked off from the seed-boxes into cold frames to prepare it for planting in its summer quarters; it will repay for the extra trouble of pricking off. Small-rooted bedding plants, such as *Alternanthera*, *Mesembryanthemum*, *Heliotrope*, *Gnaphalium*, *Koniga*, &c., are far better grown in pots, for the reason that they transplant better into their summer quarters than they do when grown in boxes or planted out in frames. Certainly pots may take up a little more room and demand a little more labour, but I think they will repay it. *W. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	April 12	Sale of Established Orchids, Japanese Lilies, &c., at the Auction Mart, by Protheroe & Morris.
TUESDAY,	April 13	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.
WEDNESDAY,	April 14	Sale of Established and Imported Orchids, at Stevens' Rooms Royal Horticultural Society of Ireland: Spring Show. Meeting of the Linnean Society, at 8 P.M.
THURSDAY,	April 15	Sale of various Importations of Orchids, at Stevens' Rooms Sale of Roses, Fruit Trees, Carnations, &c., at 38, Gracechurch Street, E.C., by Protheroe & Morris.
FRIDAY,	April 16	Sale of Scientific Instruments, &c., at Stevens' Rooms.

ONE of the most interesting, but by no means agreeable, results of the cold, wet, sunless summer of 1879, is the paucity of blossom on the fruit trees in this present spring. About London, Plum blossom is plentiful but late. The Apricots and the Almonds, which latter form such conspicuous ornaments of suburban gardens, are notably deficient. The same holds good of Peaches and Pears, and to a less extent of Apples. Was it the deficiency of light, or of heat, or of both, which has brought about the result? The safest way would be to adopt the last alternative. But the searcher after truth will not be satisfied with vague answers and possibilities. He seeks a more precise answer. In the present case this is not easy to obtain, owing to the difficulty of eliminating the effects of light from those of heat, and *vice versa*. This, then, is one of those cases in which we may fairly hope that the electric light will do service. By its means it will be possible, to a large extent, to isolate the results of light from those of heat, and thus to gain information of the highest value to physiology and of no less importance to practical culture. Our object, however, in now adverting to the subject of fruit blossoms is to follow up some remarks made last year, and to induce young gardeners to make themselves acquainted, not only with the ripe fruit they cultivate, but also with the habit of the tree, the form of the foliage, and the construction of the flower. At first sight it may be the blossom of one Pear tree seems very like that of another, but a very little investigation will show that there are considerable differences between them. It would be interesting to observe whether there is any relation between the form of the flower and the disposition of its parts and the degree of hardiness. The four varieties we figure to-day, from specimens drawn some time since by Mr. FITCH, will serve to illustrate some of the differences we have alluded to.

The main points of distinction which should be looked to at this season are the general habit of growth—erect, spreading, loose or dense, &c.; the colour, hairiness, or glabrescence of the young shoots and of the old wood respectively. In the leaves the points to be examined are the size, form, and hairiness, taking care to observe both the leaves on the barren shoots and those on the fruit-spurs. As to the inflorescence, the first thing to be noted is the date of opening, then the number, denseness or looseness of arrangement of the flowers, the form and colour of the buds, the relative length and the hairiness or smoothness of the flower-stalks.

The flower-tube (or calyx-tube) at the top of the stalk should be specially noticed, as that is the part which ultimately ripens into the fruit, the form of which is even thus early fore-

shadowed. At the top of the flower-tube are the sepals, generally broad at the base and tapering into a long point. These sepals ultimately form the "eye" of the ripe fruit, and their form is much better studied thus early than when the fruit is ripe. The petals vary considerably; in some varieties they are broad and spoon-shaped, in others much narrower. The number of the stamens should be noted, and more especially their length in relation to that of the petals. Within the stamens, at the top of the young fruit, are the styles, which vary in number, in degree of union at the base, in hairiness, &c. The woodcuts at p. 469 will indicate in like manner the variations in the form of the fruit. It may be objected that these are minute details, and so indeed they are, but it is by attention to such minute details that the young gardener succeeds in life. Such details will not only help him to distinguish between one variety and another, but they will

Triomphe de Louvain, Gansel's Late Bergamot, Belle après noel, Beurré Kennes, Forme de Bergamote, Suzette de Bavay. All these are standard trees, and there appears to be a slight advantage in those trees which are on the southern side of the quarters.

— THE ELECTRIC LIGHT AND PLANTS.—M. HERVÉ MANGON was one of the first, if not the first, to experiment with the electric light on plants. In 1861 he grew seeds of Rye under the light, and succeeded in producing the green colouring matter as under solar light. He also observed that the plants turned to the light as they would do in the case of the sun.

— ANTHURIUM ANDRÉANUM.—Great interest was excited at the 143d Exhibition of the Royal Agricultural and Botanical Society of Ghent, which opened on the 4th inst. It will be remembered that this is the Society to which English horticulturists

FIG. 81.—BEURRÉ DIEP PEAR. (SEE PP. 460, 461.)

create and foster habits of observation and discrimination of the greatest possible value to him in after life.

We may take another opportunity of alluding to these points, in the meanwhile we append a list of some of those varieties which we noted on a recent visit to Chiswick as flowering freely at this season, or the reverse. The list is by no means complete, and is intended solely to direct attention to the subject. Of varieties showing a good proportion of bloom, though in almost all cases late, we may mention the following:—Thompson's, in full bloom; Emile de Bivort, Rousselet Enfant Prodigue, Henri Capron, Marie Louise, Beurré Desais, Duc d'Angoulême, Fondante du Bois, Althorp Crassane, Catinka, Louise Bonne, Madame Durieux, Soldat d'Esperen, Charles van Mons, Colmar d'été, Comte de Paris, Emile d'Heysel, Beurré Gris, Louis d'Orléans, Belle Julie, Musette de Nancy, Maréchal de la Cour. Of varieties with little or no bloom, we may mention Doyenné de Comice, Glou Moreau, Louise de Prusse, Henry de Nicaise, La Juive,

owe so many hearty receptions—so much cordial intercourse. On this present occasion foreigners, that is to say of the human race, were not present in large numbers, their visits being specially reserved for the quinquennial exhibitions. The success of a plant at one of these great shows at Ghent, writes a highly esteemed correspondent, is like that of a well-dressed beauty at Longchamps. This time the plant that has attracted all eyes is a splendid Aroid (*Anthurium Andréanum*), of which a figure in the *Illustration Horticole*, t. 221, noted by us at the time of publication, led us to expect great things. We are assured, however, by Count OSWALD DE KERCHOVE, that the plant as shown at Ghent far excels the representation, taken from a dried specimen. The spathe is very large (*norme*), ovate, of a bright shining red, brighter even than that of *A. Scherzerianum*. Instead of being flat, as in the plant just named, the spathe in this new *Anthurium* is crumpled and traversed by deep sinuous veins, which at a distance one might take for the handiwork of some clever artist. The spadix is whitish with a yellow tip. Altogether the plant is one of the most remarkable introductions of modern times, and by itself would suffice to confer renown on the explorations of M.

ANDRÉ in New Granada. We congratulate M. ANDRÉ on his "find," and trust that M. LINDEN, through whose agency the plant has been introduced, will speedily be in a position to exhibit his treasure in London.

— CRYSTAL PALACE.—Oak-apple day, May 29, is the date selected by the authorities at the Crystal Palace for holding the annual summer show at that place. The schedule still includes two prizes only in each class, a very short-sighted policy, which will sooner or later lead to the "farming" of such competitions. The National Rose Society's exhibition is fixed for July 3.

— MASSACHUSETTS HORTICULTURAL SOCIETY.—The annual March exhibition of Azaleas and Roses took place on the 18th ult. Perhaps the choicest—certainly it was the most wonderful—feature of the exhibit was a specimen of the Azalea Exquisita, contributed by Hon. MARSHALL P. WILDER. This plant measures 6½ feet in height, and is no less than

dotted with numberless minute, pale claret spots and blotches; the prominent colour is a creamy white, but the lip is the most conspicuous both in colour and shape—the central one of the three lobes being prolonged into a stalked spade shaded body, which is so thickly covered with its purplish dots as to appear a kind of purple even at a short distance.

— NEW AGRICULTURAL COLLEGE.—It is stated that a school of agriculture is about to be established near Salisbury. Among the Professors are Messrs. CHURCH, WRIGHTSON, FREAM, and SHELDON. A farm for practical instruction is also provided.

— LUMINOUS PAINT.—Mr. BALMAINE has recently introduced a substance formed of calcium sulphide, and which, after exposure to light, becomes luminous in the dark, after the manner of phosphorus. Mixed with water or oil this substance is capable of being used as a paint. A sheet of cardboard, for instance, so painted and exposed to the light, may be used afterwards as a lamp in cellars or in places

being formed into a pleasure garden similar to those on the Victoria Embankment, and will hereafter be known as the Victoria Gardens. The ground, with the wharves and buildings upon it, was bought up in order that the Thames Embankment wall might be extended up the river from the Houses of Parliament to what is known as Dorset Wharf. After the river wall of that portion of the embankment was finished it became a question as to how the large space within it should be appropriated. There were strong objections urged to its being rebuilt upon, in consequence of its close proximity to the Houses of Parliament, especially to the Victoria Tower, which, in case of a fire taking place in any of the buildings, might be very much endangered. Ultimately it was resolved by the Commissioners of Her Majesty's Works to lay it out as a garden, and that resolution is now being carried out. To all appearance the work will be completed by early summer. A promenade has been formed on the river side, and trees planted along it. The centre of the ground has been raised into several circular mounds for the reception of shrubs, plants, and flowers, with walks round them. *Times.*

— DESTRUCTION OF FIELD MICE.—One of our readers sends us the following method for destroying field mice:—"Cut in small pieces (half an inch at most) a common sponge, and fry those pieces in dripping (like fritters) until they harden, then scatter them at the spots infested by the field mice. In a few days the swollen and dead bodies of the field mice will be found everywhere. As the bait is more alluring for the mice when dry, it is better to choose fine weather to do this. The remedy is easy, cheap, and infallible." *Jersey Express.*

— MAUVE BEAUTY STOCK.—This fine variety, when treated as an Intermediate Stock, is very fine and effective at this season of the year. Some superb specimens raised from seed sown in August last, and grown on through the winter in a greenhouse, are objects of great beauty, with immense double flowers thickly set on very large spikes; the flowers of a delicate lavender-mauve tint by no means common to ordinary Stocks. It is a variety requiring generous treatment, and according as this is given it so will be the extent of its effective floral service. It also makes an excellent summer-flowering stock sown in spring and planted out in good ground to flower in summer. A very large percentage of the flowers come fully double.

— A GRIM DISCOVERY.—A startling surprise, after the fashion of the story of GINEVRA, was experienced some days ago by a party of Styrian woodcutters in the forest of Drommling. They began to fell a venerable Oak, which they soon discovered to be quite hollow. Being half decayed it speedily came to the ground with a crash, disclosing a skeleton in excellent preservation. Even the boots, which came above the knee, were almost perfect. By its side was a powder-horn, a porcelain pipe-bowl, and a silver watch, on which was engraved the name "H. VON KRACKOWITZ, 1812." The teeth were perfect. It would seem to be the skeleton of a man between thirty and forty years of age. It is conjectured that, while engaged in hunting, he climbed the tree for some purpose, and slipped incautiously into the hollow trunk, from which there was no release, and he probably died of starvation. *Times.*

— EFFECTS OF THE GALE OF DECEMBER 28 IN SCOTLAND.—The *Journal of Forestry* remarks that now the fearful effects of the hurricane which swept over Scotland on the evening of December 28 can be fairly estimated, some conception of the enormous loss entailed by owners of property unfortunately situated within its course may be estimated when it is stated that in the Athole forest alone over 80,000 trees were blown over, and many of them broken, shattered, and rendered useless. It will take years before the disastrous results of the storm are obliterated in the districts swept by it, of which Perthshire appears to have been the vortex.

— PRIMULA PUBESCENS.—A pretty species bearing this name, but which appears to have but little of a pubescent character about it, is now flowering in one of the cold frames at Chiswick. In its

FIG. 82.—GLOU MORCEAU PEAR.

17½ feet in circumference at the head. Fair Ellen, shown by the same exhibitor, measured 5½ feet by 15 in circumference; Azalea Wilderi, 5 feet by 13; Harlequin, 5 feet by 14; and variegata, 4½ feet by 12 feet. The exhibition was a very good one, and showed that American cultivators endeavour to keep abreast of their contemporaries in the Old World. American seedling Camellias compare favourably with those of foreign origin.

— PROF. SCHIMPER.—The death of this amiable and accomplished botanist at Strassburg is announced. His researches in vegetable morphology, and in the history and classification of mosses and of fossil plants, gave him a high place among his contemporaries.

— LACAENA SPECTABILIS.—A nice plant of this apparently rare Orchid, which in habit and general appearance somewhat resembles an Acineta, is now in flower in the Kew Orchid collection. It has a conical channelled pseudobulb, about 4 inches in length, and a pendulous spike of delicate, if not brilliantly-coloured blossoms. The ground of the sepals and petals is of a pale flesh colour, which is

where an ordinary light would be dangerous or impracticable. The durability of the paint is great, and, as it is unaffected by water, it is likely to be of great service for painting buoys. The property in question is explained on the theory that rays of the spectrum, ordinarily invisible to the human eye, are taken up by this phosphorescent substance, and converted into visible light. The present cost of the paint is 28s. per pound, 1 lb. of paint being sufficient to cover about 28 square feet. In addition to the many uses to which this paint can be put, one very great advantage accruing from its use is the greatly diminished risk of fire.

— SOCOTRA.—Professor BAYLEY BALFOUR has arrived in this little-known island, of the flora of which he speaks in glowing terms. We expect great things, botanically and horticulturally, from this expedition.

— THE VICTORIA GARDENS.—The large vacant space of ground at the south-west end of the Houses of Parliament and adjoining the Victoria Tower, which is bounded by Abingdon Street on one side and by the river on the other, is now in the course of

habit of growth and character of the leaves it is not unlike *P. nivalis*; and like that species it throws up several trusses of flowers of bright mauve-lilac colour, nearly as large as those of *P. spectabilis*. Mr. BARRON obtained it in the North of Scotland, and as it is of a decidedly valuable character, it is desirable that it should be correctly named.

— ORCHIDS IN FLOWER.—The following Orchids flowered last month at Forest Farm, Windsor Forest, the residence of JOHN C. BOWRING, Esq. :—

Ada aurantiaca	Epidendrum crassifolium
Arphyllum giganteum	„ erectum
Aspasia lunata	Eria fusca
Bolbophyllum sp.	Galeandra Devoniana
Calanthe Turneri	Isochilus linearis
„ Veitchii	Liparis sp.
Cattleya citrina	Lockhartia elegans
Coleogyne cristata	Lycaste gigantea
„ pandurata	„ lamipes
„ species	„ Skinner
Colax jugosus	Masdevallia ignea
Cymbidium eburneum	„ Livingtoniana
Cypripedium barbatum	„ nycteria
„ biflorum	Maxillaria densa
„ Boxallii	„ Harrisoni
„ insigne	„ variabilis
„ longifolium	Mesospiridium sanguineum
„ pardium	Odontoglossum cordatum
„ Pearcei	„ gloriolum superbum
„ Roezlii	„ hystrix
„ Schlumii	„ Lindleyanum
„ Sedeni	„ maculatum
„ stenophyllum	„ odoratum
„ villosum	„ Pescatorei
„ new hybrid, not yet described, Roezlii	„ Roezlii
„ Pearcei	„ Rossi
Dendrobium aggregatum	„ triumphans
„ album	Oncidium aureum
„ Cambridgeanum	„ Cavendishianum
„ chrysotoxum	„ ampliatum
„ superbum	„ Papilio
„ crassinode	„ seratum
„ eburneum	„ Wertworthianum
„ heterocarpum	Phalaenopsis Luddeemanniana
„ lituiflorum	„ Scbillieriana
„ macrophyllum giganteum	Pleione, species
„ nobile	Sarcantibus bifloris
„ Pierardi	Sprautches sp.
„ latifolium	Trichopitia suavis
„ primulinum	Vanda cœrulea
Dendrobium glumaceum	„ tricolor
	„ insignis

— SOLDANELLA CLUSII.—This also is an attractive plant in the collection at Chiswick. It grows about 4 inches in height, and throws up several flowers of a very pretty bright mauve colour. It is a delightful subject for cultivation in the cold frames. Mr. BARRON is constantly making additions to his collection of hardy plants, and the frames at Chiswick furnish abundant evidence of his unremitting activity in this respect.

— THE EFFECTS OF A DRY AUTUMN.—Serious as has been the injury done to outdoor vegetation by the past winter's frosts in many parts of the kingdom, there can be no doubt that destruction would have been much more widely spread had it not been for the lengthened period of dry weather which we had in late autumn. Of this there is abundant proof at Eastnor Castle, Earl SOMERS' fine place in Herefordshire, where, as elsewhere during the last summer, the continual rains and absence of sun were very similar to what occurred in the memorable season of 1860, but the way in which trees and shrubs have withstood the frost during the last winter, as compared with the winter of 1860, is most remarkable. Amongst other things that suffered severely nineteen years ago were the large examples of *Arbutus* *Andrachne*, then killed down to the ground by the 34° of frost which was experienced; these sprouted from the stools, and once more their stems have grown to over the thickness of a man's leg. The thermometer, last December, at Eastnor, was again down to 34° of frost; but this time no further injury was done to the plants than a slight browning of their leaves—a circumstance that can only be attributable to the long stretch of dry weather which preceded the frost having prepared vegetable life generally to withstand the ordeal of severe cold, the opposite of that which took place in the autumn of 1860, when the moist mild weather continued right up to the commencement of the frost.

— DENTARIA PENTAPHYLLO.—This is a very pretty object on the rockwork at Chiswick. The flowers, which are of a pale lilac colour, and not unlike those of a single Stock, are borne in a terminal cluster, and it is well suited for the position it occupies. There are a few species in this genus, but they are seldom met with except in select collections. They require care in their cultivation, and they will repay it.

— BOUQUETS.—We have heard a lady who was an accomplished flower painter lament that, although she could pourtray flowers on canvas in a way to elicit the approval of those competent to criticise, yet she could not arrange a bouquet or a vase of flowers either to please herself or any one else, as when she attempted anything of the kind the result was usually the production of something like a haystack. There can be no question that the ability to arrange foliage and flowers differing in form and colour so as to produce a combination that satisfies the eye of taste has some pretension to be called an art, and it is an art that some individuals appear to possess instinctively, as even with very ordinary materials they can make a much more pleasing arrangement than others after an unlimited amount of practice are able to effect with the choicest flowers. The bouquets of late years exhibited by Mr. CYPHER at many of the leading exhibitions, and which are the handiwork of his daughter, have been generally noticed for their more than ordinary merits; sufficient evidence of this is afforded by the number and proportion of 1st prizes she has been awarded, and of which she holds the cards as mementos, numbering 120 1st and eighteen 2d, frequently won where the competition was unusually keen.

— CROTONS.—In spite of the many new types of Crotons which have been introduced during the past ten years or so, it is yet open to question whether for general usefulness *C. pictus* and *C. angustifolius* are surpassed or even equalled. This was the impression derived from inspecting a collection of fine young growing plants in a representative collection growing freely in a stove. Those who grow Crotons largely for decorative purposes give the preference to the two above named; and if to these be added *C. Weismanni* and *C. irregularis*, the cream of these handsome plants is obtained. In all stages of growth they colour well, and in a young state they are both bright and effective in appearance, and handsome and symmetrical in growth.

— EXHIBITION PLANTS.—Those who have seen much of the leading provincial flower shows of late years will not fail to have noticed the prominent place held by the fine plants so often shown by Mr. CYPHER, of Cheltenham. A recent sight of them leaves an impression that during the coming exhibition campaign the Queen's Road collection will in no way be behind what it has hitherto been. In what are usually understood as hard-wooded greenhouse plants there are a couple of examples of the New Holland *Darwinia tulipiferum*, in splendid condition, profusely flowered, and of beautiful colour; the red-bloomed *D. Hookeri*, equally well done; the now-seldom-seen *Acrophyllum venosum*, a medium-sized handsome specimen; the purple form of *Aphelexis macrantha*, clothed with buds. Amongst numerous Heaths is a splendid plant of *depressa*, large and covered with its yellow buds, as also is its companion in colour, *E. Cavendishiana*; the fine spring blooming *E. Queen Victoria*, many of the best representatives of the tricolor section and other summer flowerers, as well as the later blooming varieties. Of *Inoras*, all the best hybrids, including *I. Fraseri*, one of the finest. A number of immense specimens of *Eucharis amazonica*, each capable of producing a couple of score of flower-spikes; and many other representatives of the usual exhibition flowering plants, with a host of Palms, Ferns, and other fine-leaved subjects.

— BIGNONIA SPECIOSA.—In the Palm-house at Kew this beautiful climber is now flowering freely. The blossoms are large and showy—the throat being yellowish and the limb white, veined and netted with rosy purple. The neat, dark-green glossy foliage sets off to advantage the handsome flowers. As a stove climber, not too vigorous or luxuriant even for houses of moderate size, this is a decided acquisition. A native of Uruguay.

— A HISTORY OF THE EVOLUTION OF THE VEGETABLE KINGDOM.—Under the title *Versuch einer Entwicklungsgeschichte der Pflanzenwelt*, &c., Dr. ENGLER, Professor of Botany in the University of Kiel, has published the first part of an essay on the evolution of the vegetable kingdom since the tertiary period. This part relates to the extra-tropical regions of the northern hemisphere, and is illustrated by a map showing, as nearly as present knowledge per-

mits, the configuration of the land in the northern hemisphere in tertiary times. The task undertaken by Dr. ENGLER presents such formidable—we might say insurmountable—difficulties, that we can only admire his courage in attempting it. It is a subject that leaves much scope for the imagination, and one that a clever writer can render very attractive. Nevertheless, the mere collocation of the data illustrative of a theory of the descent and migration of the plants of any region is sufficiently instructive to deserve the attention of all those interested in the distribution of plants, and this is especially the case in relation to the regions under consideration. Dr. ENGLER enlarges considerably upon what has previously been written on the same subject by Dr. ASA GRAY, Sir JOSEPH HOOKER, Professor MIQUEL, Professor GRISEBACH, and others; and if he has not succeeded in throwing much light on evolution, he gives a good idea of the actual distribution of species and types. This he contrasts with their distribution in the miocene period, indicating at the same time the directions in which they have spread and migrated. Those persons who have read Dr. ENGLER's essay on the distribution and evolution of the species of *Saxifraga*, in his monograph of the genus, will be able to form an idea of the character of the present work. Disregarding the speculative element (which has, however, a great deal of probability in it), the book is an excellent one, and should be read by practical men.

— MARICA NORTHIANA.—Although of the easiest cultivation, and a decidedly handsome plant, the subject of the present notice is rarely seen in ordinary collections of stove plants. It has long been known in botanic gardens, but apparently is rare in private establishments. Perhaps the short life of the individual blossoms (hardly a single day) has something to do with this, but there is a succession of flowers from each scape, and their delicate fragrance and beautiful colouring ought to make up to some extent for their fugitive character. The outer perianth segments of the Iris-like flowers have a snowy white limb and a yellow claw, blotched and barred with cinnamon-brown; the inner perianth segments are similarly coloured, with the addition of the upper portion of the limb being a bright ultramarine-blue. A native of Brazil, first discovered in the island of Raza, near the mouth of the Rio Janeiro, by Sir JOSEPH BANKS.

— ORCHIDS AT ASHTON COURT.—It is nothing new to say that plant-houses which have an imposing appearance, and are faultless in the materials and workmanship, are often anything but faultless in their adaptability to the plants which have to be grown in them. Lofty structures, where the occupants in a great measure are necessarily too far from the glass, are particularly unsuited for Orchids, which plants are usually more influenced by the description of houses they are grown in than most things. Even with Orchids something may be done to minimise the structural defects of the house they are grown in. At Ashton Court, near Bristol, we recently saw an example of what may be done in this way, as also of the manner in which species usually grown in temperatures considerably different can be made to succeed together. Here in a lofty house with a high back wall we found *Saccolabium*, *Aerides*, *Phalaenopsis*, and *Dendrobium*, in exceedingly strong vigorous condition, along with Mexican *Cattleyas*, *Odontoglossums*, and other comparatively cool-country species, equally vigorous and showing flower profusely. Amongst the greater heat-requiring species was *Saccolabium guttatum*, very strong single growths, pushing three or four spikes; *S. retusum*, equally stout; *S. premorsum*, making a couple of breaks from the stem; *Phalaenopsis amabilis*, with thick leathery leaves, has been in flower all the winter. *Dendrobium Cambridgeanum* is generally supposed to do best under cool treatment: the plant here had fifteen flowering bulbs, several of them 20 inches in length and proportionately thick; *Dendrobium aggregatum*, covered with flowers; *D. Wardianum*, *D. thyrsoiflorum*, and many others; *Aerides quinquevulnera*, *A. suavissimum*, and *A. odoratum purpurascens*, many of the plants 5 feet high, and have not lost a leaf from the pot upwards; *Vanda cœrulea*. *Cattleyas* are represented by *C. Mossii* and other, so far as temperature, allied species; *Odontoglossum citrosimum roseum* in several large plants, some 2 feet across, composed of very large

bulbs and healthy foliage; with many others equally varied in their heat requirements. The character of the foliage gives a clue to Mr. AUSTEN'S treatment, comprising more air with somewhat less atmospheric moisture than many growers use. We do not say that where it can be avoided it is desirable to grow the greatest heat-requiring Orchids along with others that will do with a good deal lower temperature, but when the management is judiciously regulated so as to compensate as far as possible for the inevitable compromise that has to be made, Orchids indigenous to parts of the world varying more in climate than usually thought to do well together, can be induced to succeed satisfactorily.

— MELASPIHERULA GRAMINEA.—Although the blossoms of this Irid have neither size nor brightness to recommend them, the profusion in which they are produced and the length of time the plant remains in flower—without speaking of its elegant and graceful habit—render it a desirable object for conservatory or cool greenhouse decoration. The leaves are grass-like, light green, and the flowers are borne in flexuous branched panicles. In shape, these latter rather resemble some of the Gladioli; the perianth segments being acuminate, and each bearing a purplish stripe on a whitish ground. The species owes its generic name to the dark colour of its small bulbs. It is easily cultivated, requiring just the same conditions for successful cultivation as those under which *Ixia*, *Sparaxis*, *Babiana*, and the general run of Cape bulbs flourish. This, like the plant just named, is a native of the Cape of Good Hope. Specimens are now flowering at Kew.

— THE LONDONERS' GARDEN SUPPLIES.—With the opening of a new and extensive fruit and vegetable market in the City, there appears to the gaze of a daily contemporary a vista of supplies of garden produce for the famished Londoner that shall by-and-bye give the metropolis that one thing which alone is needed to make it an elysium—an abundance of fruit, flowers, and vegetables. Visions arise before the eyes of the sanguine writer of myriads of cottage gardens and garden allotments clustered near and about rural railway stations, where the cottager and the working-man shall each in his humble plot cultivate enough garden produce for the consumption of his own family, and shall, through the agency of local collectors, send the remainder, or surplus, to this new City market, where it will assist to bring down the present extortionate charges for these simple articles, and on the other hand bring to the cottager a valuable addition to his moderate store of wealth. This is a charming picture—one calculated to lead us to a glimpse of a modern Arcadia if realised; but alas! in that "if," simple but most essential of monosyllables, lies all the essence of the proposal. Rural districts, as a rule, do not provide a population sufficiently large in the near locality of railway stations to make the work of collection profitable, or the surplus garden produce sufficiently abundant. Even if in any case made a tangible fact, there remain the cost of collection, the cost of transit, the salesman's commission and market dues, to be subtracted from the sale of produce of only second-rate quality, and then the game would not be found worth the candle. The most cursory consideration shows that London, with its teeming millions of consumers, can only be supplied with garden produce by those who make it a business, devote to it a large capital, and with it apply the greatest practical experience.

— CONCERNING CIGARS.—From an interesting article in the *Chicago Druggist* on the cigar trade of the United States we gather the following particulars:—Treating first of the consumption of cigars in the United States, it is shown that during the last year the number amounted to the enormous total of 2,082,356,362, or an average of fifty cigars for every head of the population. Computing the cost of cigars with that of Wheat, it is stated to be equivalent to two-fifths of the value of the entire consumption of the latter. The cigar consumption has increased since 1874 at the rate of nearly 60,000,000 cigars per year. The cigars sold in the market of the United States may, it is said, be divided into three classes, namely, those imported, those made of imported tobacco, and those made of "domestic tobacco." All the cigars made in the United States are invariably put up in imitation Havana boxes, with

imitation labels and brands. It is doubtful, however, whether this transparent device deceives anybody, for in accordance with the United States revenue laws all boxes of cigars manufactured in the United States must not only bear the manufacturer's label, giving his full name and place of business, and the number of his manufactory, but they must also bear the United States inspector's brand. Before the present law was in force, and the duties on tobacco were low, this scheme may have been profitable, but why the practice is still adhered to by the manufacturers it is hard to imagine; for the boxes now used, being made of imported Cedar, must be very costly, and must materially increase the price of cigars. Only those of the very poorest quality are packed in white wooden boxes. "Concerning Havana cigars, an eastern paper observes that every box of cigars packed in Havana has, at least, six distinctive marks on it. First is the brand, which is burned on the upper side of the lid of the box with an iron made for the purpose; second, the label, which bears the name and address of the manufactory; third, the mark designating the size and shape of the cigars—this is usually put on with stencil; fourth is the colour mark, which is also put on with stencil; fifth, the class mark. All the round cigars made in Havana are separated into three classes:—*Primera*, or first; *segunda*, or second; and *tercera*, or third. Some manufacturers never mark any of their cigars as of the third class, not because they do not make them, but because they think they sell better without the mark. They make the first class *flor*, the second *primera*, and the third *segunda*; others mark all their cigars of the first class, and indicate the classes by the colour of the labels: and in this way none but the wholesale purchasers know the secret. The sixth, and last, is the mark denoting the number of cigars in the box. This is stencilled on the side in Arabic numerals."

— THE KING WILLIAM'S TOWN BOTANIC GARDEN.—We gather from what appears in the annual report of the King William's Town Botanic Garden Committee, published in the *Cape Mercury* of March 1, that the Curator, our occasional correspondent, Mr. J. C. NELSON, is giving great satisfaction in his new sphere of labour, the garden having been rescued by him from the utterly neglected condition in which he found it, and placed in a state of "something like order and neatness." We are glad to see that Mr. NELSON takes a wider view than his committee of the uses of a botanic garden, in an opinion which he expresses, that the growth of vegetables for sale is not the legitimate work of a botanic garden. He proposes that the more extensive raising of timber trees suitable for the colony should be entered upon, as being both more useful and more profitable.

— ARISEMA CURVATUM.—Few greenhouse plants exhibit elegance and grace of form combined with beauty in colour in so marked a degree as several members of the genus *Arisea*. The present species is a handsome plant about 4 feet high. The inflorescence crowns a scape which overtops the foliage; the tube of the spathe is cylindrical, green, obscurely striped with white; the elliptic blade arches forward, and is green on the inner surface, and brownish-red on the outer. The spadix is produced into a purplish-red tail about a foot in length. The leaves are pedate like those of the *Hellebore*, and on this account it received the name of *A. helleborifolium*, which, being a more recent one than that of *A. curvatum*, does not stand. A striking feature in this plant is the marbling of the large bracts, which closely sheathe the base of the stem—dark olive-green, red and light green being beautifully blended. It is a native of the humid forests of the Himalaya from Bhotan to Simla, and is also found on the Khasia Mountains. Specimens are now in flower at Kew.

— AURICULA SHOWS.—We may remind our readers that the shows of the National Auricula Society take place on April 20 and April 27. The former is the date of the exhibition of the Southern section at South Kensington, which, we hear, is likely to be well attended. The flowers are rapidly developing with the present milder and brighter weather, and some of the growers fear the finest blooms may have gone past—so difficult is it to fit exhibition arrangements with the changes of the

ever-varying seasons. On the later date the Northern section is to hold its show in the New Town Hall, Manchester, and we trust it may serve to help forward the revival of the taste for these interesting florists' flowers, as well as for the gold-faced *Polyanthus*, which are worthy to share in the florists' regards. The schedules of both shows are drawn up on a liberal scale, and we trust they will be as liberally responded to by the growers, and also liberally supported by a no less important class—the pleasure-seekers and sight-seers.

— RESTRICTIONS UPON HORTICULTURE.—We are glad to see that our Belgian friends intend to hold a meeting at Ghent, on the 9th inst., to protest against the measures adopted by some Governments (stupid measures, as we think) in order to prevent the introduction of plants into their respective territories. The measures are taken, of course, with a view to the prevention of the spread of the *Phylloxera*. We have again and again protested against the folly and uselessness of such measures, except in the case of Vines, and trust that our Belgian friends, whose opinion should carry the greatest weight, may be successful in their contest against mischievous ignorance. We have urged upon our Royal Horticultural Society the duty of taking similar steps in the interest of horticulture and science, and trust in the end that knowledge may prevail over ignorance.

— DESTRUCTIVE THUNDERSTORM IN SOMERSETSHIRE.—A correspondent informs us that a terrific thunderstorm accompanied by vivid lightning broke over Hatch Beauchamp on Wednesday morning at half-past 10 o'clock. On the estate of Mrs. HARDSTAFF, Hatch Court, near Taunton, one of the many fine old Elm trees in the park was struck by the lightning, and split from the top to the bottom, one piece being detached, split into matchwood, and blown to a distance of 123 yards, the ground being literally strewn with chips and branches for some 70 yards right and left of the tree. The thunder was so loud that the bells in the church tower—about 400 yards from the split tree—were heard to jingle. About 100 yards further on one of the men employed in cutting wood on the estate had the billhook hurled from his hand, one of his fingers being slightly injured thereby. One of the Vines in a vinery at the same place was also scorched at the same time. Our correspondent states, what is very remarkable, that the sun was shining brightly at the time.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, April 12, when a paper will be read by Mr. C. G. SAUNDERS, entitled "Quantity Practice." The chair to be taken at 8 o'clock.

— THE NEWCASTLE BOTANICAL AND HORTICULTURAL SOCIETY will hold its summer exhibition for miscellaneous plants, Roses, and fruit on July 7 and 8; and the autumn show, for Dahlias, Hollyhocks, Gladioli, table decorations, and fruit, on September 15 and 16.

— THE WEATHER.—General remarks on the weather during the week ending April 5, issued by the Meteorological Office, London:—The weather during this period has been much less settled than of late, the sky being generally cloudy over the whole country, with frequent heavy showers. Hail fell in some places occasionally, notably on the 5th, when it was accompanied over central England by thunder and lightning. Bright sunshine was much more continuous in the western than in the eastern parts of the kingdom, but in no district was the sun clearly visible for as much as half of the time that it was above the horizon. The duration recorded varies from 43 hours in the "Midland Counties" and 40 hours in "Ireland, N.," to 19 hours in "England, N.E." The temperature was one or two degrees above the mean in all districts. The highest of the maxima (66° at Barnstaple) occurred on March 31, but at most other stations the highest readings were registered either on March 30 or April 3. The lowest of the minima were observed during the early morning of the 30th, and at Oxford the thermometer went as low as 27°. The wind was generally south-westerly (south-westerly to westerly) in all parts of the kingdom; and, though moderate in the east and south-east, blew freshly or strongly in the west and north, and reached the force of a gale in Scotland both on March 31 and April 2. The rainfall was above the mean in all districts, the excess being very marked in "England, N.E." and "England, S.W."

## STOVE PLANTS FOR WINTER AND SPRING DECORATION.

To keep a conservatory or greenhouse gay during the summer and autumn months is easy enough, but to provide a constant succession of flowering or other ornamental plants for making a display in winter or early spring is quite another matter, and requires a good deal of forethought; and as the season has now arrived when the propagation of many of them should be taken in hand, it has occurred to me that a list of the most suitable, together with a few remarks relative to their treatment, may not be unacceptable. It will perhaps be well to notice the stove varieties first, as being the most important.

*Sericographis Ghiesbreghtii* stands foremost among these for general usefulness, and for brilliancy of colour and free-flowering qualities cannot be surpassed. Another thing in favour of this plant is that it does not require strong heat after growth is complete and it begins to expand its bloom—a time when, if afforded a temperature ranging anywhere between 50° and 60°, the plants will do much better, and last in beauty considerably longer than they would in one that is higher. Cuttings put in now in any warm close pit, or under bell-glasses in the stove, where they can be kept shaded, will soon root, and should then be potted off singly in small pots, and stood on a back shelf in any forcing-house, or, better still, on a hotbed in a Melon or Cucumber frame, as there the genial atmosphere will at once start them into rapid growth, and cause them to become quickly established. The natural habit of the *Sericographis* is rather thin and spare, but if stopped occasionally by nipping out the points of the shoots it may be induced to become tolerably bushy; but this should not be done after the end of July, or middle of August at the latest, or they will not have time to ripen and set their flower-buds, which are formed in the axils of most of the upper leaves. The best soil to grow them in is about equal parts of leaf-mould and loam, or any refuse peat and the latter, to which should be added a sprinkling of sand to keep the mixture porous. Except for old plants that have been cut back, 6-inch pots are quite large enough, as they do not require much root-room, and such sizes are far handier for general purposes than others that get a more liberal shift. The most suitable place to grow them during the summer and autumn is a pit of sufficient depth to hold a little plunging material, such as leaves or tan, in which to stand the pots, and if these are in a very slight state of fermentation, so much the better, as a little bottom-heat will keep them in a greater state of activity, and induce a more vigorous growth. Besides frequent watering they will require during dry weather, they should be well syringed, or damped overhead, about 3 o'clock every afternoon, and have the lights closed immediately after, which will be the means of creating an atmosphere highly conducive to the welfare of the plants. If this treatment is steadily pursued till the end of September, or middle of October, it will then be time to take them into a warm house, where they can enjoy a night temperature of about 55° till they begin to expand their flowers and are required for use elsewhere.

*Linum trigynum* is likewise a grand winter-flowering subject that should be largely grown where a display has to be kept up at that season, for when well managed it blooms in the greatest profusion, and being of a bright yellow shows up well in contrast with the above. The great difficulty many have with this *Linum* is in keeping it free from red-spider; and this, unless a special course of treatment is pursued, is a matter of impossibility, so susceptible is it to their attacks. The only way I can ever manage them successfully is by keeping them in a frame by themselves, and syringing them heavily overhead at least once a day, taking care when doing so to wet the undersides of the leaves thoroughly, as there it is these pests assail them, and cause such a disfigurement. In syringing these plants it is highly important that the water should be applied with some force, as the foliage is of that peculiarly smooth nature that wet does not stand on it; and this is one of the reasons why red-spider gets such a hold, and is not easy to eradicate. After trying various composts to grow *Linum* in, I find there is nothing suits them so well as thoroughly decomposed leaf-soil, to which a slight portion of fibry loam and sand has been added to give it weight, as in this the roots can ramify easily

and the water pass readily through. When growing freely they can scarcely have too much of this, provided they have heat in proportion, which should be afforded by closing early in the way recommended for the *Sericographis*. To attempt the culture of *Linum* in houses, with the pots and plants exposed to dry currents of air, is useless, as it is sure to result in failure; but kept in a pit or frame there are no plants that may be grown with greater ease, and few that yield a better return for the care and attention bestowed on them. Cuttings made of the young shoots, and put in sandy soil under a bell-glass in moist heat, will root in a week or ten days; and these, if potted on, will make nice bushy little specimens by the winter. Any old ones that may have been kept should be shortened back a little, and divested of all the old shabby leaves that appear likely to harbour insects, and after this is done shaken out and potted, and then placed in close moist heat, to give them a start, after which the pit or frame, as already mentioned, is the proper situation for them. Although I have placed the *Linum* among stove-plants it requires but little more heat during the winter than that of an ordinary greenhouse, in which temperature, if the atmosphere is kept moderately dry, it will retain its blooms much longer, and remain a considerable time in perfection.

*Rivina humilis* is a plant of great decorative value that may be got up to a useful size quickly, and is just the thing for amateurs and others having only a limited amount of room, and who require something they can manage easily, and which when grown can be made use of in their dwellings for the embellishment of the dinner-table or other similar purposes. *Rivina humilis* is especially adapted for this kind of work, if not kept too long out of heat so as to cause its berries to fall, as they unfortunately do rather easily after they have become fully ripe. The best way of growing the plants is to run them up with clean stems about a foot high, in which way they show off their numerous long racemes of flower and fruit to the greatest advantage. These have much the appearance of bunches of red Currants, but are more glossy and polished looking, so that any one unacquainted with the plant may readily conceive how exceedingly ornamental it is. If a few seeds are sown at once in heat they will be found to germinate readily, or cuttings put in strike with great freedom; but the seedlings are always preferable, as they grow stronger and make the best standards. In order to get them to set their berries freely they should be subjected to plenty of light, which will likewise induce a short-jointed compact growth, resulting in well-formed close little heads. Almost any kind of soil suits them, and 6 inch pots are quite large enough unless extra sized plants are required, in which case they must be shifted quickly and have a brisk moist heat afforded them. By pruning or stopping a few back occasionally and starting them into growth again they may be had in full beauty nearly the whole year round, and eventually got to form quite large specimens suitable for exhibition.

*Centropogon Lucyanus* is another valuable cool stove plant, which is suitable for small collections, both on account of its moderate growth and exceedingly floriferous habit. So free is it in this respect that it not only blooms at the ends of every one of the main shoots, but when these are cut or die away it breaks again at the axils of the leaves, and yields others for months in succession. The shape and general appearance of the flowers resemble those of the *Eschynanthus*, as does also in some respects the plant, and like the *Eschynanthus* it may be grown in baskets for suspending, in which way they show off to great advantage. Those who are not so fortunate as to possess any stock of this *Centropogon*, may, by purchasing one now, soon work up as many as they require, as it strikes freely from cuttings made of the young tender growth taken off with a heel. The shoots to form these should not be more than from 2 to 3 inches long, and if these are put in in strong moist heat they will soon be ready to pot off, after which the best place for them is in a pit where they can be plunged and treated similarly to the *Sericographis*. This plan of managing this class of plants not only relieves the stove and renders it available for the principal specimens, but it suits them both so much better to be separated, as the one is not then overshadowed by the other. Although the *Centropogon* will grow in almost any kind of soil, it succeeds best in good fibry peat, in which it should not be potted over firm, but be well drained, as it requires plenty of water during the summer. J. S.

(To be continued)

## Home Correspondence.

*Xerophyllum asphodeloides*.—On opening my *Gardeners' Chronicle* (p. 433) I was agreeably surprised by the flattering notice of the *Xerophyllum asphodeloides* exhibited by me, and now answer the implied question as to how we grow it. Till lately we had only two plants, one in a shady part of the rock-work on a soil of about half foam and half sand and then peat added; here it grows and flowers fairly well, but our best plant is in a shaded cool damp rock border, the soil being about two parts peat and one of sandy loam. Here along with *Trilliums*, *Cypripedium spectabile*, *Lygodium palmatum*, *Andromeda tetragona* and *fastigiata* (the last given me by, and a valued remembrance of, Dr. Moore, of Glasnevin), it seems thoroughly at home. Having lately become possessed of a few more plants, I am trying them in the wild garden, under different conditions of shade and damp, and will report the result. A pan of seed has as yet made no sign: if this grows I shall have means of trying the effect of *Xerophyllum* on beds, which would, I think, be very striking. We have now in the wild garden a bed of the yellow Dog-tooth Violet, *Erythronium americanum*, growing and flowering freely; it is in shade in the black vegetable soil, which seems exactly to suit it: with a number of flowers out at once it is a beautiful object. The wild garden is a great success. After beginning experiments on plants in a sandy dry hot field with the "pan" below—where, though I cannot say with Crabbe, "And the blue Borage marks the sterile soil," the *Erodium* did this thoroughly, and we had soil, shade, and shelter, all to make—you can then imagine the luxury of having dropped into a garden, or rather plot of ground, where in the small space of 5 acres there is every condition of soil from sand to good loam, and from dry vegetable black earth to black bog, and situations from hottest sun to completest shade; so that within a short stone's-throw we have a roasting bank, with soil and aspect perfect for *Ixias*, *Calochorti*, *Millas*, &c., and a cool black bog, in which the great double *Caltha* given me by the great gardener of Aldborough, the Rev. Mr. Nelson, is luxuriating and is now flowering in all its gorgeous beauty. Mr. Dominy used to say that a gardener should have two lives; the next best thing is as at Bitton, where two generations have enthusiastically carried on the garden. I am working at the wild garden as hard as other engagements will permit, in hopes that my son may follow the good Bitton example. *George F. Wilson, Heather-bank, Weybridge Heath.*

**Double Cinerarias.**—I always looked on double *Cinerarias* as useless and unsatisfactory flowers, until I received a few flowers from Mr. Greenfield of the Priory, Warwick, of his magnificent varieties, Mr. and Mrs. Thos. Lloyd, the flowers of which are more like miniature *Pyrethrums* than *Cinerarias*; and with stems 2 to 3 inches long, one may imagine to what decorative purposes they may be put. The flowers I received are 1½ inch in diameter. As an old Floors man I beg to congratulate Mr. Greenfield on his success as their raiser, and the Messrs. Veitch on their acquisition. Double *Cinerarias* are now a reality and worthy the public appreciation which I believe they are destined to gain. *Henry Knight, Floors.*

**Plants by Post.**—In those interesting notes by a lady headed "Garden Gossip," on p. 425, I see oiled silk recommended for enclosing plants by post. A cheaper and lighter material, quite as useful for the purpose, is gutta-percha membrane, of which I enclose a specimen. I call attention to it in hope that an increased demand and production may lower the price, which at present, though less than that of oiled silk, is high enough to make a serious item of expense to those who use the post much for the transmission of plants. When we see the large gutta-percha air balls which are sold in the streets for a penny, it seems to me that the tissue enclosed ought to be made for less than 3d. a square foot. *C. W. Dod, Grange-over-Sands.*

**Aaron's Rod.**—The botanical name of Aaron's Rod is *Verbasum Thapsus*. There are two reasons why this should be called Aaron's Rod: firstly, the Romans dipped the stems of this plant in tallow, and burnt them at funerals! Secondly, the simple spike is long, cylindrical, on which is a quantity of densely packed, very large, and handsome golden-yellow flowers. The stem is 5 feet high. The flowers when dried in the sun give out a fatty matter used in Al-ace as a cataplasm in hemorrhoidal complaints. The leaves are ovate, excessively woolly both sides. Formerly it was called *Barbasum*, from *Barba*, meaning a beard, in allusion either to the shaggy nature of its foliage, or else to two of the five stamens, which are hairy. It is a biennial, flowers in July. This when cultivated is very beautiful, often growing 8 feet, and is well worth the attention of both ama-

teur and professional gardeners. The *Solidago virgaurea* is occasionally known and called Aaron's Rod, but only then, I fancy, in mistake, *W. Roberts*, 9, Chapel Street, Penzance, March 30.

**Thinning Pseudobulbs.**—Orchids, I think, are not strengthened but rather weakened by thinning their pseudobulbs, whether these appear old and leafless, or blind and fresh; for they are thus deprived of a store of nourishment reserved in the swollen portion of the stem. This is of a succulent character, containing many spiral cells and vessels, which, from their elasticity, keep the tubes pervious and favour the rapid transmission of fluids, while a thick epidermis prevents absorption by the atmosphere. A similar provision is made in the case of some terrestrial Orchids, by tubercles at the roots, which abound in starchy matter and minister to the growth of the young shoot. But since personal experiment first and observation afterwards are both necessary to direct and substantiate our notions regarding natural phenomena, I removed all the old and leafless and a few blind pseudobulbs from *Cattleya Mossiae*, *Laelia anceps*, *Epidendrum cochleatum*, and *Dendrobium nobile*. Two years have since elapsed, and the plants which, before the operation, were making good progress, received a check from which they have not yet entirely recovered. As a research into the nature of the vegetative organs of Orchidaceæ has begun in the laboratory at Kew, by a distinguished

to mourn here except Broccoli. I think I have six left out of 1000. Scotch Kale, too, is very much cut up, also Parsley; with these exceptions there is not much but what can be easily made good. What are we to do in the face of all this disaster and disheartening affair? Some will perhaps give up in despair, but I would advise them to do nothing of the sort, but to set to work with patience and perseverance to repair the actual losses. Carefully cut away the parts that are dead, and trim the others in shape so that they are missed as little as possible. A great many of the blanks may temporarily be filled up during the summer months with tall-growing annuals and foliage plants, and spare greenhouse plants, many of which can still be raised from seed, such as Tobacco, Helianthus, Wigandia, variegated Maize, Cannas, Amaranthus, and a host of things which I believe would be an agreeable change. *A. W.*, *The Gardens, Preston Hall, Kent.*

**Asparagus Kale.**—I can fully endorse Mr. Horsefield's remarks as to the usefulness of this vegetable. The reason of its oftentimes rotting off in

mind I have spent several hours amongst them, examining growing specimens to see whether I could find any doubtful or intermediate forms. The distinctions appeared to me, in several hundred specimens I looked at, to be quite constant, and could not be accounted for by any difference of soil or position. The two species grow together amongst the same rocks, and frequently in the very same crevice, close to one another. *A. viride* does not begin to be common until about 1000 feet above the sea level, though *A. trichomanes* grows quite down to the seaside. I could not ever find *A. viride* on these hills growing on the open face of rocks, or in any place exposed to much sun, though the other grows abundantly on perpendicular rocks, even with a full south aspect. *A. viride* delights in those narrow crevices of which the surface of the limestone is full, growing 1 or 2 feet below the ground level, between natural walls of rough rock about 6 inches apart, where it can always see the sky above its head, but no sun for more than a few minutes each day. In these fissures *A. trichomanes* grows equally well, and both grow together to the very summit of mountains 2000 feet high; though as the elevation increases *A. viride* becomes relatively more common. Still the distinctions are quite as marked at the highest elevation, where they grow together, as at the lowest. I succeeded at last in finding one plant which had three or four fronds with black stalks, mixed up with others

German botanist, we hope to receive some light in this direction. *James Scott, Edinburgh Gardens.*

**Effects of the Winter on Hardy Plants.**—I find on looking at the record of frost which has been carefully kept here, that on December 2 we had 27°; on the 3d, 24°; on the 7th, 26°; on January 20, 19°; on the 26th, 21°; and on the 28th, 20°. There has not been so long and severe a winter since 1860, and had it not been that we have a good dry subsoil (gravel and Kentish ragstone) we should have fared far worse than we have done, and that is bad enough. We had as good specimens of *Laurustinus* as are often met with; now they look as if scorched, and a great number of them have been killed to the ground line. *Laurus nobilis* (the Bay) has shared the same fate, while *Eunymus* are all killed down, except radicans variegata. *Arbutus*, too, are for the most part killed down; *Aucubas*, Portugal and even common Laurels have suffered severely; *Phillyreas* and some of the evergreen Oaks have lost their foliage, and are much injured; Conifers have come off pretty well, although some of the foliage is very brown and falling off, but I hope they will all recover. The St. John's Wort even has not escaped, but is killed down to the ground line. *Rhododendrons* are not much hurt, except a few of the hybrids and tender varieties. The Pampas-grass, which was not protected, I am afraid is much injured. The flowers in the borders have suffered much, such at least as are in any degree tender—*Carnations*, *Pinks*, *Statice*, *Santolina*, *Chrysanthemums*, *Lobelia cardinalis*, and a host of little things one meets with as they walk around. The kitchen garden has fared better, simply because in the winter there is not so much to kill but what is quite hardy. I have not many losses

the autumn is, I think, to be explained by its being sown and planted out too early. In most places the middle of April will be found quite early enough to sow, and it should be the last of the winter greens to be planted out, for if it has become very strong and bushy in the autumn, it will, from its dense habit of growth, be constantly saturated to such an extent that many of the plants will be fairly killed. *W. B. Glascock, The Gardens, Shirley Park, Croydon.*

**Trug Basket** (p. 436).—Have not we the precise word from which the above (slightly localised in pronunciation in one part and translated in the other) is taken in the German compound, "Trag-korb," a pannier, hamper, or portable basket? See *Flügel's Dictionary. O.*

**Asplenium viride.**—More than once lately, whilst rambling amongst the mountain limestone hills through which the Settle and Carlisle Railway runs, I have been surprised to see the abundance of *Asplenium viride* growing mixed up with *Asplenium Trichomanes*. Mr. Bentham, in his *Handbook of British Flora*, says of *A. viride* that though in the first edition he treated it only as a variety of *A. Trichomanes*, he has in his second edition admitted it as a species "only in compliance with general custom." Bearing this

having green stalks. I thought at first that the colour was due to their withering, but I afterwards observed that the withered stalks of *A. viride* turn to light brown and not to black. I am not certain, however, that these are not two plants grown into one, and I have sent it to a good botanist for his opinion. *C. Wolley Dod, Grange-over-Sands, Lancashire, April 2.*

**The Edelweiss** (*Gnaphalium Leontopodium*).—Any one wishing to raise this plant from seed had better sow at once in shallow pans, well drained and filled with a compost of sandy peat. Cover the seeds very lightly, place the pans in a warm house, and be careful never to let the soil get dry. In about a fortnight the seeds will be through the soil. I sowed on March 5, and have now some scores of seedlings up, which I shall prick out under hand-lights. Here on the sandstone it thrives vigorously. *A. Brown, Pusey Gardens, Farington.*

**Seedling Anemones.**—For supplying large quantities of cut flowers in winter and spring few things are more useful than seedling plants of *Anemone coronaria*. Early in February I was through the well-kept gardens of Doneraile Court, and on a south border there were several rows of plants, which even at that early date were blooming freely, and comprised a great variety of remarkably rich colours; and I was informed that they had been in bloom more or less throughout the winter. The seed was sown last May, in rows a foot apart, the ground having previously been well manured; the

only attention the plants received being to keep them free from weeds. *H. C.*

**Saxifraga oppositifolia.**—This prettiest of native Saxifrages, which has been nearly cleared from North Wales, except on inaccessible precipices, still survives in tolerable plenty on some of the less frequented mountains of Yorkshire. I saw it in full flower there on March 22, defying the east wind and frost; for at that elevation—2000 feet above the sea level—in spite of a bright sun at mid-day, the ground was hard frozen, and the small pools coated with ice, yet this hardy little mountaineer was as bright as summer, its apparently leafless tufts of purple flowers lying so close to the surface that it looked as if the rock itself was in flower. *C. Wolley Dod, Grange-over-Sands, April 2.*

**Cattleya crispa superba.**—Mr. Williams in his *Orchid Manual* considers this one of the finest Cattleyas in cultivation. Sepals and petals pure white, lip rich crimson, and beautifully fringed. This magnificent variety is undoubtedly all that is here described, and it is to be regretted that it is so rare as not to be seen oftener. The true variety is perfectly distinct from other Cattleyas, and easily distinguished by the numerous dark brown spots over the upper and lower sides of the leaves. No other Cattleya with which I am acquainted has the same free distinct spotting. In reality it is a superb Cattleya, and its fringed lip enhances greatly its beauty. *Henry Knight, Floors.*

**Charcoal.**—In answer to "A Pembrokeshire Gardener," I may say that charcoal is made into an excellent manure by absorbing from the atmosphere, or earthy substances with which it is in contact, ammoniacal vapours and saline solutions which are very beneficial to vegetation, and without which they could not live. Now wood charcoal (for there are two sorts, wood and animal), as it is very light and porous, has great affinity for vapours, absorbing a large amount of ammonia, and  $9\frac{1}{2}$  of oxygen. Ammonia is present in, and is given off from, all dead and decomposing animals and vegetables. It is also one of the chief constituents of manure, without which it is almost worthless. Wood charcoal also possesses deodorising, disinfecting, and decolorising properties, which are entirely dependent on its absorbent qualities. Seeds sown, and plants grown in moistened charcoal, sprout and grow with remarkable quickness. I think that the best way to use charcoal is to mix about half and half with manure, or to carry the urinal water of stables and shippens, and empty it on to a heap, or even let it steep in water from the dung-heap, so that it may collect and retain the salts and solutions which are necessary for the well-being of the future plant. There is also another very valuable fertiliser, but which must be used with caution, or it will do more harm than good. This is the black dust of the flues and chimneys, which contains from 18 to 48 per cent. of mineral matters, which are found in combination with it, consisting of the earthy matters of the coal, and of compounds of gypsum and sulphates, which are obtained from the lime of the flue and the sulphur of the coal. It also contains from 1 to 5 per cent. of ammonia. Gypsum is composed of  $41\frac{1}{2}$  parts of lime and  $58\frac{1}{2}$  of dry sulphuric acid, and the sulphate is composed of the sulphate of magnesia (or the epsom salts of commerce), and is generally procured after evaporating common salt from sea-water. These compounds are for the most part very soluble, and enter into the composition of almost all vegetables. It is only by a knowledge of these things by which we are enabled to see and understand the effects of elements that are wrought each day by the never-altering laws of Nature. *F. K. Holden.*

—My experience of this goes to prove that nearly all plants grown in pots are greatly benefited by its use, stove plants and Ferns especially so. I have generally used sand and dust, in about equal proportions. Why should not outside crops like it as well? At most places where an establishment is kept up it can generally be obtained gratis. *J. B. Combe.*

**Peaches and Nectarines.**—The prospect of a crop of these outdoors during the present year is a very poor one, for on examining the trees I find the wood is badly injured by the severe and protracted frost, and the buds are very small and weak looking, which betokens imperfect organs within. Ripe wood is always considered the first essential towards getting fertile blossoms, and if this is so necessary, as no one at all acquainted with fruit culture can doubt, the chance of the blooms setting is a very forlorn one, as in most places the shoots are green and soft, with leaves still hanging, and, what I fear is worse, the bark has its sap-vessels ruptured to a serious extent, for when cut into I find it is much discoloured and full of dark spots, which, under the microscope, appear to be particles of decayed vegetable matter, evidently brought about by the action of frost. Such an affection as this must disorganise the health of the

trees, even if it does not kill many outright, as seems inevitable, as when overtaken by winter they were in full growth, most of which was made quite late in the autumn. Unfortunately nothing can be done at present but to remove the most crippled, and replant with others from reserve walls, as to attempt any sort of pruning till the buds become more advanced is useless, and would be likely to help in carrying the decay further back. In ordinary seasons it is generally preferable to leave Peach wood full length, but much shortening will have to be done this spring, the points of the shoots being quite soft and shrivelled, and totally unfit for laying in to fill up the gaps. That on young trees, however, if alive, should be preserved, that the spaces they are intended to occupy may be covered as quickly as possible, the extension system being far the best with these, as the more the branches lengthen the more the roots extend and the faster the stems and trunk swell—all tending directly to establish the plants speedily, and bring them into a fruit-bearing state. I have seen healthy young trees from nurseries shockingly maltreated, the shoots being cut off to within a few inches of their base, thus leaving the trees mere stumps with large wounds to heal over, whereas had they been planted almost intact they would have been far better in every respect, and the loss of at least a year saved. When behaved in that way all that they can do in the time is to make about the same number of branches of similar length, which, strange to say, are frequently subjected to the same kind of treatment again. A young Peach that is healthy and has the right sort of soil to grow in does not require these persuasive influences to break back, as it will do that fast enough and make shoots less gross and watery with growth equally distributed, instead of being drawn away by one or other of the gourmands taking the lead. *J. S.*

**Artificial Manures.**—In the issue of the *Gardeners' Chronicle* of July 12 of last year, in the course of some remarks of a general character on Potatoes I alluded to an interesting trial of three Potato manures then proceeding here, and fully described the nature of the trial, how conducted, length of rows, quantity of manure given to each row, and various other particulars that it is not now desirable to recapitulate, as any reader may refer to the number of that date if desirous of so doing. Now that the planting season is approaching, and the minds of growers, both large and small, are being turned to the production of good profitable crops, I have numerous applications from those who evidently had read my remarks last July, and now want to know something as to the result. As the matter has a general interest for all Potato growers, I ask leave to add now what I then left unfinished and unsaid. The three manures employed were not sent with the maker's compliments and gratis with the hope expressed that a favourable report might be made concerning them, but were ordered and paid for in the way of business, therefore I can write of them and their merits, or otherwise, with entire freedom. They were as under:—Messrs. Clay & Levesley's "Fertiliser," Messrs. Morris & Griffin's, of Wolverhampton, special Potato manure, and a special Potato manure manufactured by Messrs. F. C. Hills & Co., of Deptford. Clay's Fertiliser is without doubt a splendid pot-plant manure, and I found, used with early Potatoes grown in pots, that the effect was remarkable. Only a few days since I heard it spoken of by an eminent gardener, who used it specially with his pot Strawberries, as a "wonder," and he was quite enthusiastic in its praise, and with good reason. Used in quantities of one-half soot to one-half of the Fertiliser, the effect on the plants was indeed wonderful, and the swelling crop of fruit a remarkable one. As a special Potato manure for outdoor crops its effects are less marked, and although its highly concentrated nutritive properties may act with good effect upon a succeeding crop, its immediate effects upon the Potatoes are not so great or so sensible as was shown by Hill's manure, which is also cheaper, and evidently prepared to meet the needs of the Potato plant and the formation of tubers. The rows were 122, each 50 feet in length and 3 feet apart. The sets were of same size and selection throughout, the soil freely worked, but of moderate quality, having had no animal manure applied for two years, and the quantity of artificial manure of each of the three sorts used was 4 lb. per row of 50 feet, or at the rate of about half a ton per acre. As the Potato plants grew the effects of the respective manures on the tops was most obvious—that of Hill's so far exceeding the others that ere the haulm was half grown the rows where this manure was applied could be picked out from the rest with ease. The best and most satisfactory test, however, was found at the scales, when the produce of all the earlier kinds was lifted, for not only were the samples throughout from Hill's manure finer, but the produce greater, as the following results will show:—Early Lemon Ashleaf gave to Hill's manure 52 lb. per row, and to Morris' manure 41 lb. per row. Early Bird Ashleaf gave to Hill's 45 lb. and to

Morris' 37 lb. In the same order Bedford Prolific gave 40 lb. and 35 lb.; Rector of Woodstock, 46 lb. and 37 lb.; Porter's Excelsior, 52 lb. and 42 lb.; White Emperor, 40 lb. and 28 lb.; Feltham White, 45 lb. and 35 lb.; and a single row planted farther on with Clay's Fertiliser gave 39 lb. Woodstock Kidney gave to Hill's 50 lb., and to Morris' 35 lb., Avalanche 42 lb. and 31 lb., and Emerton's Advance 54 lb. and 42 lb. The kinds planted in three rows with one kind of manure to each row were chiefly late ones, but the following, got up before the disease had largely spread, although the growth was checked, gave as under:—International Kidney: Hill's 54 lb., Clay's 46 lb., and Morris' 46 lb. Vicar of Laleham: Hill's 50 lb., Clay's 45 lb., and Morris' 36 lb. All the other kinds were not weighed, because the continued rains made the soil so adhesive that no fair test of bulk could be had, but all through the greater value of Hill's manure was most evident. This is an impartial and exact recital of the results, and those who read may deduce from it their own conclusions. *A. D., Bedford.*

## Reports of Societies.

**Royal Caledonian Horticultural: April 7 and 8.**—The spring show of this Society was opened on Wednesday in the Waverley Market, Edinburgh, and closed on Thursday night. It was one of the finest displays we have seen in the North at this early season, and the weather being fine there was a good company. The nurserymen of Edinburgh, as usual, showed forth with prominence, the Rhododendrons exhibited on one of the tables by Messrs. Downie & Laird being one of the greatest features of the show: we noticed amongst these a gorgeous *R. Broughtonii* some 12 feet in height and nearly as many through, John Downie, Prince Camille de Rohan, and many others nearly approaching it in size and equalling it in profusion of bloom; this firm also carried off the first honours in both classes of greenhouse Rhododendrons, a plant of Countess of Haddington being particularly grand. From the Lawson Seed and Nursery Company came a fine display of Conifers, standard Sweet Bays, with a number of fine-foliaged stove and greenhouse plants arranged with considerable taste on the floor. Messrs. Ireland & Thomson came well to the front as usual, with an excellent display: we noticed in particular some fine specimen Crotons of Weismanni and other favourite kinds. Interspersed in this collection were a few nice Orchids, Dracaenas, Azaleas, &c.; also a plant of the charming Rhododendron Countess of Dalkeith. In Messrs. Dickson & Co.'s display were a few good Tree Ferns and a quantity of herbaceous spring-flowering plants, for which this firm is noted. *Pyrus Maulei*, in very small pots, was covered with bloom. Messrs. Methven & Sons exhibited some good Todeas and decorative Pelargoniums, with Rhododendrons and other forced flowers, which made a good display. Mr. Robertson Muir staged an admirable group of herbaceous plants, which were very effective in their way and attracted much attention. Messrs. Gordon & Sons had a table of flowering plants, in which were some good Calceolarias, Azaleas, &c., and a quantity of the charming *Primula nivalis*. Messrs. James Dickson & Sons exhibited twelve Conifers in baskets, which were all that could be desired, in form and variety of colouring, to illustrate what may be effected by judiciously planting this class of tree. Messrs. Todd & Co. took the 1st prize for table and hand bouquets, and exhibited also some floral decorations for dinner-tables.

Amongst the amateurs the competition in most classes was keen, and we observed some excellent Azaleas. These were as perfect as possible, the flowers of good size and substance, and the plants literally covered. Mr. Paterson, of Millbank, took three 1st prizes, the other falling to Mr. Smith, of Restalrig—Mr. Paul, of Gilmore Place, showing well up in these classes. In stove and greenhouse plants Mr. Paterson again distinguished himself, showing admirable specimens of *Erica Cavendishiana* and *Sindryana*, *Azaleas Model* and *Roi Leopold*, *Pultenia subumbellata*, and *Anthurium Scherzerianum*. Mr. Paul and Mr. McCormack also showed well here. Some very fine Ferns were staged by Mr. Pearson, gr. to Lady Lucy Dundas, Beechwood; by Mr. R. Johnston, gr. to F. Gibson, Esq., Dalkeith; and by Mr. McDonald. In Mr. Paul's collection was a very fair plant of *Microlepia hirta cristata*.

Dr. Patterson, of Bridge of Allan, exhibited a very fine specimen of *Anthurium Scherzerianum*, also a very nice collection of Orchids, in which were fine plants of *Chysis bracteescens* and *Cymbidium Lowii*, and beside them was staged *Anthurium Williamsii*, with some fine spathes expanded. Mr. Paul took the 1st prize for six Orchids, with nice plants of *Oncidium sarcodes*, *Masdevallia Harryana*, *Phalaenopsis Schilleriana*, *Cypripedium villosum*, *Dendrobium densiflorum* and *D. nobile*; Mr. Walker, of Lanark, being 2d with *Cypripedium villosum*, fine *Masdevallia Veitchii*, and a gem of a plant of *Lycaste*

Skinneri alba, and three other good plants, which we think must have caused some trouble to the judges in giving their award.

In the class for two Orchids Mr. Curror, gr. to G. Douglas, Esq., of Eskbank, was placed 1st with *Dendrobium luteolum* and *D. Pierardi* major; Mr. Paul 2d. Mr. J. Boyd, of Falkirk, was placed 1st for a single specimen with *Cattleya Skinneri*; a fair plant of *Renanthera coccinea* was also noticed. *Ericas* were not exhibited in any quantity, the 1st prize for four falling to Mr. Paterson, Millbank, who had *E. ventricosa coccinea* minor, *florida*, *profusa*; Mr. McCormack being 2d.

For tables of ornamental foliage and flowering plants combined, Mr. Priest, of Newbattle, led the van. He staged some fine *Azaleas*, *Crotons*, *Pelargoniums*, and similar plants, and a few good Orchids dotted amongst them: this was considered for style and finish the best table. Other tables were exhibited by Mr. Green, gr. at Falcon Hall; Mr. Reed, gr. at Ravenswood; and Mr. J. Spence, gr. to J. Buchanan, Esq., Oswald Road, in all of which were to be found examples of good gardening.

The *Hyacinths* at this show made one of the great features, and absorbed a vast amount of interest. In the class for eighteen that veteran in their culture, Mr. J. Cowie, of Morningside, was placed 1st. In his collection were fine examples of William I., Marie, Mont Blanc, Seraphin, Lord Derby, Gigantic, Grandeur à Merveille, &c. Mr. Ker, gr. to Alex. Hope, Esq., Chapel-on-Leader, was 2d, and Mr. McLure, gr., Trinity Grove, 3d. For nine *Hyacinths* Mr. Pearson, gr., Beechwood, was 1st, and Mr. Walker, gr., Rosehall House, 2d. In the two classes for six *Hyacinths* Mr. J. Johnston, gr. to Mrs. Gordon, of Clunzon, and Mr. Robertson, of Brunton Cottage, Canon Mills, were respectively placed 1st. Mr. Gordon, of Niddrie, staged some excellent *Polyanthus Narcissus*, as also some grand cut *Roses*. In pot *Roses* Mr. Bryson, of Helensburgh, and Mr. Paterson carried off the honours in their respective classes. Messrs. Downie & Laird were awarded the 1st prize for eighteen *Hyacinths* in the nurserymen's class, as also for twelve *Cyclamens*.

Messrs. Thomson & Sons, of Clovenfords, made a grand display on one table with forced flowers, including excellent *Azaleas*, *Spiraeas*, *Lily of the Valley*, &c. In like manner Mr. Taylor, Hermitage, Leith, also much distinguished himself, his table being tastefully arranged.

A small display of fruit was staged, Mr. Anderson, of Oxenford Castle Gardens, carrying off the prize in both black and white *Grapes*; Mr. Kentoul, Bothwell Bank, the 1st for *Strawberries*; Mr. Potter, Seadiff Gardens, North Berwick, for *Apples*.

A number of tables of spring flowering hardy plants in pots were staged and attracted universal notice, they either having been just lifted from the open borders, or grown for a short time in pots in cold frames. Large quantities of *Palms* were also exhibited, some by the leading nurserymen, some also kindly sent by Mr. Saddler from the Botanic Gardens. Taken as a whole, it may be considered as one of the finest spring exhibitions yet held by the Society.

**Obituary.**

THE death of Mr. THOMAS PERKINS, formerly the head of the nursery and seed firm of Messrs. Thomas Perkins & Sons, of Northampton, removes a central figure from the circle of the nursery and seed trade in this busy town. His death was not unexpected. He had been in a weakly state of health for some time past, and on the 3d inst., after a long and painful illness, he passed away, having attained his fifty-eighth year on March 23.

The name of Perkins has for a long time been honourably associated with the nursery business in Northampton. The first of that name to embark as a nurseryman was the father of the Thomas Perkins whose death is now recorded. Commencing in a small way, in course of a few years the business grew in importance, and it is now carried on by Mr. John Perkins, his son. Family circumstances necessitated the establishment of a second business—that known as the firm of Messrs. Thomas Perkins & Sons.

Mr. Thomas Perkins was for some time associated with his father in business, and at the age of twenty-three, desirous of extending his experience, he went to the Handsworth Nurseries of Messrs. Fisher & Holmes, at Sheffield. In 1853 he entered into business at Atherstone, and was making good headway, but upon his father requesting him to return home he gave up his connection at Atherstone, and went back to Northampton. He had not been there long before he deemed it necessary again to make an attempt in business on his own account, and in 1857 he went into partnership with Mr. John Marsh at

Northampton, under the title of Marsh & Perkins, as nurserymen and seedsmen. In 1867 Mr. Marsh retired from the firm, and the business was carried on by Mr. Perkins till within the past two or three years, when he retired in favour of his two sons, who are now the partners of the firm. In course of time the business grew into one of great dimensions, and included the cultivation on a large scale of plants suitable for covert purposes; and an extensive connection was formed among the leading landed proprietors in the county of Northampton, and those counties adjacent to it, among whom Mr. Thomas Perkins was highly esteemed. Forest trees, fruit trees, Conifers, *Roses*, &c., are cultivated on a large scale, and an extensive business is done with the trade. Mr. Perkins was well-known for his honourable dealings; all his enterprises were unvaryingly successful in their results, and his sound judgment and experience were much sought after, especially by country gentlemen. He was an ardent lover of fox hunting, riding to hounds when it was possible to do so, and frequently rising very early in the morning, so as to get his business arrangements forward before mounting his horse. Though he had retired from the nursery business he still followed the avocation of a farmer, and grew Peas, Mangel, Turnips, Kohl Rabi, &c., for seeds. A. D.

**The Weather.**

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 7, 1880.

- April 1.—A fine bright day, partially cloudy till evening, then cloudless. Frequent rain and hail between 2 and 4 P.M.
- 2.—Overcast and dull till evening, then fine and bright. Rain fell frequently till 2 P.M.
- 3.—A fine bright day. Strong wind. Overcast at night. Mild.
- 4.—A fine day, cloudy, with slight showers at times. Bright and cloudless after 6 P.M. Windy.
- 5.—Generally fine and bright, though frequently dull, with heavy showers till 4 P.M.; fine after, cloudless at night.
- 6.—A dull morning, fine but cloudy rest of day. Cloudless at night. Slight shower, and thunder heard at 5.30 P.M.
- 7.—A fine bright day, cloudy at times. Cool.

LONDON: *Barometer*.—During the week ending Saturday, April 3, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.24 inches at the beginning of the week to 29.34 inches by the morning of March 31; increased to 29.74 inches by the evening of April 1; decreased to 29.45 inches by the afternoon of the 2d; increased to 29.60 inches by the afternoon of the 3d; and was 29.58 inches at the end of the week. The mean reading for the week at sea level was 29.78 inches, being 0.44 inch below that of the preceding week, and 0.17 inch below the average.

*Temperature*.—The highest temperatures of the air observed by day varied from 61½° on April 3, to 50° on March 28; the mean value for the week was 55½°. The lowest temperatures of the air observed by night varied from 27¼° on March 29, to 44° on April 3; the mean value for the week was 36½°. The mean daily range of temperature in the week was 19°; the greatest range in the day being 28½°, on March 29, and the least 13°, on April 1.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—March 28, 39°.7, — 3°.3; 29th, 39°.8, — 3°.5; 30th, 45°.6, + 1°.9; 31st, 45°.2, + 1°.2;

April 1st, 45°, + 0°.8; 2d, 44°.5, — 0°.1; 3d, 51°.7, + 7°.1. The mean temperature of the air for the week was 44°.5, being 0°.6 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 127½° on April 3, and above 107° on March 28 and 29; on April 2 the reading did not rise above 55°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 23° on March 29, 24½° on the 31st, and 27° on the 28th; the mean of the seven lowest readings was 31½°.

*Wind*.—The direction of the wind was variable, and its strength strong at times.

The weather during the week was fine, though cloudy at times.

*Hail* fell on April 1, and *fog* prevailed on March 29.

*Rain* fell on three days during the week; the amount measured was 0.53 inch.

ENGLAND: *Temperature*.—During the week ending Saturday, April 3, the highest temperatures of the air observed by day were above 61° at Blackheath (London), Cambridge, Nottingham, and Sunderland, and below 55° at Brighton, Bradford, and Leeds; the mean value from all places was 59½°. The lowest temperatures of the air observed by night were below 30° at Plymouth, Bristol, Blackheath, Cambridge, Wolverhampton, and Nottingham, and above 34° at Bradford, Leeds, and Sunderland; the mean value from all places was 30¾°. The extreme range of temperature in the week was above 36° at both Cambridge and Nottingham, and below 21° at both Leeds and Bradford; the mean range from all stations was 28¼°.

The mean of the seven high day temperatures was above 56° at Truro, Leicester, Cambridge, and Nottingham, and below 51° at both Bradford and Leeds; the general mean from all places was 54°. The mean of the seven low night temperatures was below 36½° at Brighton, Blackheath, Cambridge, Wolverhampton, Nottingham, and Hull, and above 40½° at both Truro and Sunderland; the mean value from all stations was 37¾°. The mean daily range of temperature in the week was above 20½° at Cambridge and Nottingham, and below 12° at Bradford and Leeds. The mean daily range from all places was 16¼°.

The mean temperature of the air for the week from all stations was 44½°, being 1° higher than the value for the corresponding week in 1879. The mean temperature was above 46° at Truro, Leicester, and Cambridge, and below 43° at Brighton, Wolverhampton, and Leeds.

*Rain*.—Rain fell on three or four days in the week at most places; the heaviest falls were 1¼ inch at Truro and Hull, and 1 inch at Wolverhampton, Nottingham, Bradford, Leeds and Sunderland, and the least fall was a quarter of an inch at Sheffield; the average fall over the country was eight tenths of an inch.

The weather during the week was generally fine, but dull and showery at times.

*Fog* was prevalent at some places on March 29 and 30.

SCOTLAND: *Temperature*.—During the week ending Saturday, April 3, the highest temperatures of the air observed by day varied from 59° at Dundee, to 54½° at Aberdeen; the mean value from all places was 56½°. The lowest temperatures of the air observed by night varied from 27° at Paisley to 32° at Aberdeen; the general mean from all stations was 30°. The mean range of temperature in the week from all places was 26¼°.

The mean temperature of the air for the week from all stations was 44¾°, being 1½° higher than the value for the corresponding week in 1879. The mean temperature was the highest at Leith, 46½, and the lowest at Aberdeen, 42¾°.

*Rain*.—The heaviest falls of rain were at Greenock, 1.35 inch, and at Aberdeen, 1.15 inch; and the least falls were at Leith 0.37 inch, and Edinburgh, 0.39 inch; the average fall over the country was 0.77 inch.

DUBLIN.—The highest temperature of the air was 58½°, the lowest 27¼°, the extreme range 31¼°, the mean 46¼°, and the fall of rain 0.32 inch.

JAMES GLAISHER, F.R.S.

**Variorum.**

SORGHUM CULTIVATION FOR THE PRODUCTION OF SUGAR IN AMERICA.—That the Sorghum plant is capable of producing sugar in sufficient quantities to cause it to be grown in some of the warmer parts of the globe for that purpose is well known; owing, too, to the saccharine matter contained in the stems, the plant is often grown as a fodder plant. Quite recently, however, Sorghum has been brought prominently forward for extended cultivation in America as a sugar yielding plant. This question has formed the subject of an official report from the

Secretary of the British Embassy at Washington. It would seem from this report that at a "Sugar Convention," held last year, the claims of Sorghum or Imphee as a sugar-producing plant were fully discussed by very competent authorities. The Commissioner of Agriculture, it is stated, showed that the Sorghum cane gave an excellent fibre after the extraction of the sugar, and that it could be worked up at any paper-mill; he advised, however, that the stalks be returned to the field, so that there would then be no danger of deteriorating the soil. The saccharine matter being derived entirely from the atmosphere, there is no reason why, even by cultivating the plant on the same ground year after year it should not increase in fertility. Again, the crop of seed or profit is very important, for it is as good for stock as any grain raised, and is even good as a breadstuff. The Commissioner of Agriculture is further reported to have said that he believed "that the different agricultural sections will have their central factories; that the farmers will boil their Sorghum or corn syrup to a density of ten or twelve pounds to the gallon, then take it to the factory and get fine sugar in return." It was also pointed out that since 1849, 1,080,000,000 dols., in gold and silver, have been obtained from the earth, and that during the same number of years 1,250,000,000 dols. have been paid by the country for sugar—170,000,000 dollars more than the production from the mines. Therefore this new industry is of the greatest importance to the country. It is not considered that Sorghum will ever compete with Beetroot for the production of sugar, but it has the advantage of requiring less machinery and less capital for its manufacture. Sugar can be obtained from Sorghum in a small way for home consumption better than from Beet. Sorghum contains ordinarily from one and a half to two per cent. more sugar than the juice of Indian Corn. Regarding the deterioration of juices, it is stated that the juice of the Beet will blacken in the course of a very few minutes, Indian Corn in the course of two or three hours, and Sorghum, perhaps, in six or eight hours. Ordinary land will produce from 160 to 200 gallons to the acre, and by special culture it may be made to run up to 250 to 300 gallons. On the Missouri River, where there is a calcareous soil, tolerably rich, 250 to 300 gallons to the acre have been obtained, and without special cultivation. The best manures for use are phosphates, lime, wood ashes, and plaster of Paris, which is exceedingly advantageous. The growth of the stalks of Sorghum may be increased to an incredible extent by the use of plaster of Paris, with some thinning of the juice it is true, but still the average production to an acre would be very much increased by its use. The difficulties which formerly existed with regard to the cultivation and production of sugar from the Sorghum have been, during the past, to a great extent overcome; one of the difficulties was that the crop was liable to failure because of the lateness of its ripening, so that it did not mature until after corn ripened, and was therefore liable to be lost by frost. The seed has now been tried far down in Texas and high up in Minnesota, and it has everywhere been successfully cultivated and has proved prolific. In 1878 there was a considerable quantity of syrup produced in small quantities, but in 1879, from the greater breadth of land cultivated, the production has been largely increased. "The Sorghum cane is prolific in its seed, which is as valuable as Oats or corn for food for domestic animals. The yield of seed ranges from 15 to 30 bushels an acre, which at 25 cents a bushel is equal to from 4 to 8 dols. per acre. The manner of cultivation is the same as for corn. The Commissioner of Agriculture calculates that if every man who plants corn will plant an additional acre of Sorghum, he will be able to supply his own household with sugar and syrup. If he plant an additional 5, 10, or 20 acres he will have sugar and syrup not only at a low cost for his own use, but to sell. Sugar and syrup, which are now among the more costly of family expenditure, will be then within the reach of every man who will plant a few acres of Sorghum, and without reducing his acreage in other crops he will add to his list of productions for sale. The sugar and syrup thus obtained will be of a quality superior to that generally sold by the refineries; it will be the pure product of the cane, not adulterated and poisoned as nine-tenths of the sugar and syrup sold by the grocers now." This is a highly flavoured prospect of a new branch of cultivation for America, and notwithstanding that more might in all probability be done with Sorghum than is at present done, we fear it will be some time before all the prophecies as to its future, contained in the report, are fulfilled.

**ORCHIDS COMBINED WITH OTHER PLANTS.**—The flowers of nearly all Orchids are either beautiful or singular in appearance, very often both; yet, with comparatively few exceptions, when out of bloom they are amongst the least inviting in appearance of all cultivated plants. Take, for instance, a house filled with the cooler section, comprising *Odontoglossums*, *Masdevallias*, and such of the *Epidendrums*, *Laelias*, *Lycastes*, and others that succeed with a little

warmth—or the intermediate division, represented by *Cattleyas*, *Oncidiums*, and the many species belonging to other genera that need a medium temperature. For a considerable portion of the year, when few are in flower, it must be confessed that the contents of such houses are as little interesting as any assemblage of plants well could be, except to those fully initiated and enthusiastic in Orchids and their cultivation, to whom the promise held out by healthy thriving plants, coupled with their value, offers enough in future prospect to compensate for the sameness of the time being. This is a feeling we have often experienced when viewing even the best collections of these plants, but we never had it so forcibly impressed upon us as by contrast during last autumn, when an opportunity occurred of seeing a valuable and extensive collection of Orchids, where in each house there was introduced a sufficient number of other plants, such as small and medium sized elegant-habited *Palms*, *Ferns*, and a few other things, including narrow-leaved *Dracenas*, *Curculigos*, and the like. These were not present in numbers sufficient to in any way impart a miscellaneous character to the contents of the houses, or reduce the collection of Orchids in the estimation even of those who care little for other plants than them, much less to interfere with their treatment or requirements, but were used just to take off the monotonous appearance present when Orchids occupy the houses alone, which, excepting such things as some of the stately *Vandas*, *Angraecums*, or the drooping *Dendrobiums*, present little relief in their habit of growth, but which relief is obtainable by introducing a few things like those we have mentioned, without any detriment to the Orchids, as evident by the excellent condition of the collection we speak of.

**Answers to Correspondents.**

**BOLBOPHYLLUM:** T. T. We cannot find any such species as *Bolbophyllum speciosum* "in the books," and have never heard of it as a garden name.

**CAUTION.**—It appears that a man representing himself to be connected with a Dundee firm is victimising gardeners by inducing them to purchase "tweeds" at a price far beyond their value. We have heard of this gentleman before, with "his pilot jacket, Scotch cap, and sailor-like appearance." Such rogues find in gardeners a too easy prey.

**CINERARIA:** H. H. Your seedling is one of the largest we have seen, being fully 2½ inches across, and though large, not at all coarse in appearance. It is of a lovely colour, a deep bright violet with a black disk. Its only fault is, that, for its size, its florets are not quite broad enough to completely fill out the circle. As a decorative plant it must be very effective, but we should look to its being made the parent of better formed varieties.—J. F. Mould. A batch of large, high-coloured, and very showy sorts, many having the necessary dark disk. They are a little coarse, and wanting in symmetry of form.

**GARDENERS' TROUBLES: ERRATUM.**—At p. 436, for the date May 29, read May 17.

**HARROTHAMNUS FASCICULATUS:** H. Simes. The plant requires greenhouse treatment, and is of the easiest culture. It requires plenty of pot-room, and a rich loamy well-drained soil, such as will induce free vigorous growth which should be well ripened by the end of the summer, and will then flower during the autumn. It is a not unsuitable plant for a conservatory pillar when there is room for it, but being soft-leaved will require to be guarded against attacks of red-spider by keeping it sufficiently watered at the root, and by frequently syringing the foliage.

**INSECTS:** H. H. Your Chinese Arbor-vite trees are being destroyed by myriads of an aphid new to us. Fumigation with brimstone might be applied to any particularly choice specimen under a para-peticoat (invented by Dr. Lindley), but could not be used in an extensive manner; neither does syringing seem available over trees like Arbor-vite. I. O. W.

**IRON STAKES:** C. Tress. Iron painted stakes, used for Roses and fruit trees, are not at all injurious, but very serviceable on account of their durability.

**MELONS:** A. M. We cannot say definitely what may be the cause of the injury, but should imagine that it was the result of sun-scorching. If you give air a little earlier in the morning, so as to dry up any moisture on the plants before the sun gets much power, there will probably be an end to the mischief.

**NAMES OF FRUIT:** H. Woodmancy. Your Pear is named Josephine de Malines.

**NAMES OF PLANTS:** H. W. Dugman. Not the double form of the common wild Daffodil.—R. S. 1, *Doronicum austriacum*; 2, *Symphitum officinale*.—H. C. 1, *Pteris hastata*; 2, *Asplenium monanthemum*; 3, *Davallia Iyeri*, if with silvery scales; 4 and 5, *Cyrtanthium caryotideum*; 6, too little developed, but probably *Goniophlebium vacciniifolium*.—H. E. T. 1, *Blechnum occidentale*; 2, *Platyoloma rotundifolium*; 3, not fertile; 4, *Lastrea decompositum*; 5, *Pteris tremula*; 6, *Pteris hastata macrophylla*.—J. A. E. 1, *Asplenium bulbiferum dissectum*; 2, *Lastrea patens*; 3, *Asplenium praemorsum*; 4, *Pteris crenata*; 5, *Blechnum cognatum*; 6, *Asplenium bulbiferum*, strong leafy variety. The rest next week—six being the limit at one time.—E. Flynn.

2, *Aralia Veitchii*; 3, *Spathiphyllum cannefolium*; 5, *Niphobolus lingua*; 6, *Adiantum assimile*; 8, *Mimulus cardinalis*; 10, *Monsoa incisifolia*. The others, not being in flower, are not determinable.—T. B. *Dendrobium luteiflorum*, and *D. Wardianum*, very poor; a poor variety of *Cypripedium venustum*, and *Phaius grandifolius*. None of them were numbered.—T. Smith. Your *Begonia* is not at all like the variety mentioned.

**PRIMROSES:** E. 7. L. The crosses are not very apparent. The best are Nos. 5, 11 (too streaky), 2 (lobes too wide apart), 16 (too small); the two prettiest are 9 and 71, but both are pin-eyed; 9 is very bright, with large orange eye and white dotted margin; 71 is remarkably smooth-edged, and will make a good mother; the others, Nos. 1, 51, and 19, are worthless.

**RICHARDIA:** D. C. P. The double-spathed *Arum* is by no means a rarity. See our vol. ix., 1878, p. 241. Keep the plant, and see if it will repeat the freak.

**TREE CARNATION:** H. B. Fine in colour, and doubtless a showy decorative sort, but utterly wanting in all the properties which constitute a good flower.

**VERONICAS:** C. F. F. We do not know where you can get seeds of the plants named, but plants can be obtained from such nurseries as Backhouse's, York; Parker's, Tooting; and Ware's, Tottenham.

**VINES: Enquirer.** Your Grapes and Vine-leaves are injured by some scorching heat-fumes—most probably the sulphur from the pipes, the tissues being very tender.—F. H. We have examined the Vine leaf sent, and can find no trace of any insect attack. It is probably due to the health of the Vines, or some atmospheric influences.

\* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

**CATALOGUES RECEIVED:**—Rawlings, Brothers (Old Church, Romford), Descriptive Catalogue of Dahlias.—Edward Gillett (Hampton County, Southwick, Mass.), Price List of Native (American) Perennial Plants.

**COMMUNICATIONS RECEIVED.**—C. W.—W. G. S.—A. D.—W. B. G.—E. W.—S. R.—P.—W. Jinks.—J. R. J.—J. E. H.—W. Roberts (Yes).—D. B.—H. J. Ross.—Louis de Smet.—C. W. S.—A. M.—W. H. F.—H. S.—M. P. W.—M. C. C.—O. de K.

**Markets.**

COVENT GARDEN, April 8.

We have no alteration to quote, prices remaining about the same, with a good supply and a quiet demand. James Webber, Wholesale Apple Market.

CUT FLOWERS.—WHOLESALE PRICES.

Table listing various cut flowers and their wholesale prices, including Abutilon, Arum Lilies, Azalea, Bouvardias, Camellias, Carnations, Cyclamen, Epiphyllum, Eucharis, Euphorbia, Gardenias, Heliotropes, Hyacinths, Lily of Val, and Mignonette.

SEEDS.

LONDON: April 7.—Notwithstanding the excitement over the elections there is now an active seasonal demand for all kinds of farm seeds. Holders in London being anxious to clear out their stocks are accepting mutually moderate rates. The choice Canadian red Clover seed, which was sent here on consignment, is obtainable at unprecedentedly low figures. Alsike also is extremely cheap. Trefolds, and especially the lower qualities, are easier. There is no alteration in grasses. Of Sainfoin the stock appears all but exhausted; for the very small quantity remaining 3s. per quarter more money is demanded. From France no further supply is obtainable. Lucerne and Timothy continue scarce. There is a good demand for spring Tares, and values exhibit considerable firmness. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Trade was very dull at Mark Lane on Monday, and quotations were somewhat flatter. In English Wheat there was no material change—being next to nothing passing; but in foreign Wheat there was a reduction of 1s. per quarter. Barley met with a slow sale, and about supported late rates. Malt changed hands quietly on former terms. Oats were in moderate demand, and prices improved to a slight extent. Maize was flat, at a reduction of about 1s. per quarter. Beans were firm, while Peas were rather dull. Flour moved off to a small extent at somewhat weaker rates.—On Wednesday the tone of the market as regards Wheat was perhaps a trifle firmer than on Monday, the supply being on a limited scale, but the amount of business doing was so small that prices were almost nominal. Barley was very quiet. Malt was unchanged. Oats were in moderate request, at fully late improvement. Maize was dull at Monday's decline. Beans were steady, Peas dull, and flour quiet and without change.—Average prices of corn for the week ending April 3:—Wheat, 48s. 4d.; Barley, 35s.; Oats, 22s. 6d. For the corresponding period last year:—Wheat, 40s. 11d.; Barley, 32s. 6d.; Oats, 21s. 1d.

CATTLE.

At Copenhagen Fields on Monday the number of beasts was considerably larger than on the Monday previous, and the trade was not so active, consequently prices were lower, and some interior qualities remain unsold. There was a considerable increase in the supply of sheep, for which there was a fair demand at rather lower prices. Lambs on the average sold lower, yet choicest qualities continued dear. Good calves maintained late rates. Quotations:—Beasts, 4s. to 5s., and 5s. 4d. to 5s. 10d.; calves, 5s. 6d. to 7s.; sheep, 4s. 10d. to 5s. 2d., and 5s. 8d. to 6s. 2d.; lambs, 7s. 4d. to 8s. 4d.; pigs, 3s. 6d. to 5s.—On Thursday supplies were short. Beasts were in fair demand, at improving prices. Sheep and lambs were scarce, and decidedly dearer. Calves sold at full prices.

HAY.

The Whitechapel Market report of Tuesday states that the trade was dull for fodder, but prices remained firm for the quotations:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 102s. 6d.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—Thursday's market was fairly supplied with hay and straw. A dull trade prevailed, and prices were steady.—Cumberland Market quotations:—Superior meadow hay, 98s. to 108s.; inferior, 50s. to 76s.; superior Clover, 120s. to 132s.; inferior, 80s. to 105s.; and straw, 36s. to 40s. per load.

POTATOS.

From the Borough and Spitalfields Markets reports we learn that supplies have been moderate, and trade remains steady at fully previous rates:—Scottish Regents, 140s. to 160s.; Champions, 180s. to 200s.; Lincoln ditto, 170s. to 180s.; Victorias, 160s. to 180s. per ton; German reds, 5s. 6d. to 7s.; Dutch rocks, 5s.; French white, 5s. per bag.—During last week 43,771 bags 7271 sacks were received at London from Hamburg, 7644 Bremen, 1078 bales Harlingen, 400 sacks St. Nazaire, 300 tons Drontheim, and 600 sacks Rotterdam.

COALS.

The following are the quotations current at market during the week:—Walls End—Lambton, 14s. 6d.; Wear, 13s. 6d.; South Hetton, 15s.; Chilton Tees, 14s. 6d.; Thornley, 14s. 6d.; Hetton, 15s.; Hetton Lyons, 13s. 6d.; Hawthorns, 13s. 9d.; Original Hartlepool, 15s.; Tunstall, 13s. 6d.; Tees, 14s. 9d.; Radford Navigation, 15s. 9d.

Alternantheras from Stores.

W.M. BALCHIN begs to offer the following varieties:—AMENA, SPATHULATA, VERSI-COLOR, AMABILIS LATIFOLIA; also MESEMBRYANTHEMUM CORDIFOLIUM VARIEGATUM, and LOBELIA BRIGHTON, 8s. per 100, 70s. per 1000. MENTHA PULEGIUM, 6s. per 100. Terms cash. Hassock's Gate Nursery, Keymer, Sussex.

The best, and will become the most popular and profitable plant of the year.

IVY PELARGONIUM MRS. H. CANNELL.—Illustrated in Gardeners' Chronicle, Gardeners' Magazine, and Florist and Pomologist, and is admitted by all who have seen it to be an acquisition, and one of these good plants that only come occasionally, and give everybody satisfaction.  Samples and Price Lists free.  
**J. SMITH, The Royal Label Factory, Stratford-on-Avon.**

**Oil Paint No Longer Necessary.**  
**HILL AND SMITH'S BLACK VARNISH,** for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.  
 Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

**UNSOLICITED TESTIMONIAL.**  
 "Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chestow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chestow.—I am, Sirs, yours respectfully, WM. COX."

**CAUTION.**—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.  
 H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.  
 Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c. sent free on application to  
**HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.**

**FOR LAWNS.**

No one possessing a Lawn should be without this wonderfully useful little invention.

The following particulars, from the *Gardeners' Chronicle* of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of Mr. ALFRED F. O'C. HURRY, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Second Edition, crown 8vo., 3s. 6d.

A YEAR in a LANCASHIRE GARDEN.

By HENRY A. BRIGHT. "It is full of admirable suggestions for the practical gardener as to the choice and arrangement of his plants, but it will also be read with interest in the arm-chair in town. It is the true story of a year's gardening, written by an accomplished man whose flowers tell him many stories and pleasant things not to be found in the nurseryman's catalogue. . . . A faithful and fascinating garden story." Times.

MACMILLAN and CO., London.

PANTON'S CALENDAR.

Now ready, a Revised Edition of the COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

Originally Compiled by the late Sir Joseph Paxton, M.P. PRICE 3d., POST FREE 3½d.

W. RICHARDS, 41, WELLINGTON STREET, STRAND

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

WANTED, a GARDENER, married, without family, under 30; must understand Flower and Kitchen Gardening and Management of Glass. A knowledge of Cows and Meadow Land required. An Abstainer and a Singer preferred. Three small rooms over stable at present.—State wages to H., Abinger Rectory, Dorking.

WANTED, IMMEDIATELY, an UNDER GARDENER. Must understand Cows.—G. HOWARD, Oaklands, Cricklewood, London, N.W.

MESSRS. JAMES VEITCH and SONS are REQUIRING, for the United States, a young man, with first-class experience as a PLANT-GROWER, Orchids especially. Liberal wages to a really good Plantsman.—Apply, by letter, addressed Royal Exotic Nursery, Chelsea, S.W.

WANTED, a man, as GROOM and GARDENER; married, without family.—Apply to Mrs. H. STALEY, Thorntree House, Newhall, Burton-on-Trent.

WANTED, a ROSE and FRUIT TREE GROWER, in a small Nursery near London. Encouragement will be given to a persevering and obliging man. One who has been accustomed to the Execution of Orders would be preferred. Good references as to sobriety indispensable.—Address by letter to D. M. D., Gardener's Chronicle Office, W.C.

Stove and Hard-wooded Plants. POUNCE and SONS are in WANT of an Experienced PROPAGATOR and GROWER of the above for Marketing.—Write, stating qualifications, age, wages required, and when disengaged, to J. POUNCE, The Nursery, Hendon, Middlesex.

WANTED, a PROPAGATOR for the Herbaceous Department, under the Manager. Must know something of Perennials and Alpine Plants.—THOMAS S. WARE, Hale Farm Nursery, Tottenham, London.

WANTED, a Young Man for the Houses; quick at Potting, &c.—FRAS. R. KINGHORN, Sheen Nurseries, Richmond, Surrey.

WANTED, IMMEDIATELY, a Young MAN, for Kitchen Garden and Orchard-house.—Reply, stating experience, reference, &c., to THOMAS HEDLEY, Putteridge Park, Luton, Beds.

WANTED, IMMEDIATELY, a MAN (Single-handed), to Grow Cucumbers, Cut Bloom, &c., for Market. Wages 21s. a week.—Apply, with references, &c., to JOHN GOODLIFF, Jun., "George" Hotel, Huntingdon.

WANTED, IMMEDIATELY, a steady active MAN, well up in Growing Plants for Market; also TWO Young MEN, used to Potting, Tying, and Watering.—Apply, with references, to JOHN TURTLE, The Nurseries, Welling, Kent.

WANTED, a Young MAN, to attend to Fires and assist in the Houses; must have had some experience, and not afraid of work.—Apply to JAMES SPENSER, Holloway Down House, Leytonstone.

WANTED, a LAD, about 16 or 17, who has been accustomed to Work in Greenhouses.—Apply to Mr. J. CROUCHER, Sudbury House, King Street East, Hammersmith, W.

Seed Trade. WANTED, a Young MAN, who has a knowledge of Book-keeping, and will make himself generally useful about the place, serving at counter occasionally.—Apply, with full particulars as to wages, &c., to F. B. G., Gardener's Chronicle Office, W.C.

Florist Trade. WANTED, a respectable Young MAN, with good address, of attentive and obliging manners, to attend to a Show-house, and Wait upon Customers. Must be a good Bouquetist and well acquainted with the trade.—State age and particulars to Mr. CALE, Floral Commission Agent, 4, Tavistock Row, Covent Garden, W.C.

To Bouquetists, &c. WANTED, a Young LADY in a West End Florist's Establishment. Must have had considerable experience in the Cut Flower Trade, and good testimonials.—Apply to A. B., Gardener's Chronicle Office, W.C.

WANT PLACES.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

JOHN ROBSON, The Downs, Altrincham, can with confidence recommend Two experienced Young Men of good character, one as HEAD GARDENER in a good establishment, and the other for a SINGLE-HANDED situation.

To Gentlemen and Growers for Market. MANAGER, to a Gentleman intending to invest Capital in a Horticultural Business to Grow extensively for Market, Grapes, Peaches, Strawberries, Cucumbers, Gardenias, Roses, Stephanotis, &c. Experienced in Erection of Houses best adapted for market work. Highest references.—READ, 36, Grove Road, Falcon Road, Battersea, London, S.W.

GARDENER (HEAD).—Age 34, married, one child; practical. Good character.—GARDENER, Nursery Cottage, Orchard Terrace, Chichester.

GARDENER (HEAD), to any Nobleman or Gentleman requiring the services of a thorough practical Gardener.—Age 35, single; three years' unexceptionable testimonials.—HEAD GARDENER, Tisbury House, Wilts.

GARDENER (HEAD).—A GENTLEMAN wishes to recommend his Gardener. He understands Vines, Hotheuses, &c., and has had four or five men under him.—Mr. W. M. P., Heybride Tean, Stoke-on Trent.

GARDENER (HEAD), where one or more are kept.—Age 25; eight years' experience in all branches. Could make Butter if required. Five years' good character.—J. D., Albert Cottage, Fort Street, Sandown, Isle of Wight.

GARDENER (HEAD).—Age 34, married, no family; understands Stove and Greenhouse Plants, Orchids, Early and Late Forcing, Pines and Melons, Flower and Kitchen Gardening. Seventeen years' experience.—A. D., Blendworth Lodge, Horndean, Hants

GARDENER (HEAD); age 37, married.—A GENTLEMAN, altering his establishment, highly recommends his Head Gardener. Twenty-two years' experience in all branches.—J. S., The Sherlock, Vutley Laoc, Reigate.

GARDENER (HEAD); age 28, single.—Mr. CONSTANTINE, Head Gardener, Hillingdon Court, will be pleased to recommend the Advertiser, who has been with him two and a half years. Twelve years' good practical experience.—W. MARTIN, The Gardens, Hillingdon Court, Uxbridge.

GARDENER (HEAD), to any Lady or Gentleman requiring the services of a thorough practical and energetic man.—Age 45, married, no incumbrance; twenty-five years' experience in all branches of the profession. Highest testimonials. Leaving through the death of his employer.—D. B., 15, Rocky Hill, Maidstone, Kent.

GARDENER (HEAD).—G. LUCAS, Gardener for fourteen years to R. S. Holford, Esq., Weston Birt, is at liberty to engage with any Nobleman or Gentleman where first-class gardening is required. Can stand test in his abilities in any way desired, and can have a character of the highest order, also recommendations from Nobleman and Gentlemen who have seen his abilities.—G. LUCAS, New Church Street, Tetbury, Gloucestershire.

**GARDENER (HEAD, WORKING).**—Age 30; fifteen years' practical experience. Good references.—C. S., Greenford Green, near Harrow, Middlesex.

**GARDENER (HEAD, WORKING).**—Age 31, two children; thoroughly competent. Fourteen years' experience in all branches of the profession.—H. A., Feltham Hill Road, Hounslow, W.

**GARDENER (HEAD, WORKING).**—Married; over ten years' practical experience. Character will bear the strictest investigation.—H. POLLARD, Parsloes, Chadwell Heath, Essex.

**GARDENER (HEAD, WORKING),** where more are kept.—Married, no family; 20 years' experience in all branches.—Two years' character.—R. WALKLING, 3, Lower Linn Road, Haverstock Hill, N.W.

**GARDENER (HEAD, WORKING).**—Age 30; thoroughly practical in all branches of the profession. Excellent character.—GARDENER, W. G. Smith, 38, Barkbeck Road, Upper Holloway, N.

**TO SEEDSMEN and FLORISTS.**—Wanted by a young man a situation to Assist in Shop.—T. BARNES, Horley Surrey.

**TO LADIES and GENTLEMEN**  
The Leading Journals write in our Favour.  
A BEAUTIFUL HEAD of HAIR, WHISKERS, MOUSTACHES, and EYEBROWS.  
No more Disappointments—Beware of Worthless Preparations.

UNDER THE PATRONAGE OF THE ROYAL FAMILY.  
The "Court Circular" says:—  
"The MANY preparations now before the public for the purpose of facilitating the growth of the hair are so numerous that any information in regard to a REALLY GENUINE ARTICLE must meet with GREAT SATISFACTION. We have seen the effects of WARDE'S HAIR PRODUCER upon a lady's head, the scalp of which had become almost bald, as the result of a severe sickness. After perseverance with this speciality, which has proved itself in our minds to be the MOST GENUINE and RELIABLE of the CAPILARY GERMINATORS before the public, our fair friend regained possession of her lost tresses, which ARE, EVEN NOW, MORE PROLIFIC THAN BEFORE."  
COMME IL ETAIT. COMME IL EST.

AS IT WAS. AS IT IS.  
This desirable effect, a BEAUTIFUL HEAD of HAIR, WHISKERS, MOUSTACHES, and EYEBROWS, Speedily brought about by  
**WARDE'S HAIR PRODUCER (not a Dye),**  
Sent, carriage paid, to any address, upon receipt of remittance, value 2s. 6d.; three bottles, 6s. Directions for use with each bottle.  
Sole Proprietors, C. WARDE and CO., 16, Great Marlborough Street, London, W.

This preparation, the Result of Patient Research, is a blending of ingredients only known to the Proprietors. As the result of its alimentary properties, it stimulates apparently decayed hair-bulbs, is a renovator of the natural colour of the hair, prevents baldness, and keeps the hair from turning grey; is a cleanser of the scalp, is a radical cure for scurf and dandruff, is perfectly harmless, and is the most refreshing and invigorating of hair washes (for which purpose one tea-spoonful to half-a-pint of water will be found sufficient). It acts as an emollient, thereby removing all harshness from the hair, to which it gives a luxuriant growth and beautifully soft texture. It contains no oleaceous matter whatever.

Persons visiting warm climates should take a supply with them, as it counteracts the injurious effects of the sun upon the capillaries.

WARDE'S HAIR PRODUCER can be procured for you by any Chemist from the Wholesale Houses, viz., SANGER'S, NEWBURY'S, EDWARDS'S, BARCLAY'S, HOVEN-DEN'S, SUTTON'S, MAW'S, &c

**KINAHAN'S LL WHISKY.**  
**KINAHAN'S LL WHISKY.**  
Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.**  
Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1855, the Gold Medal.—20, Great Titchfield Street, London, W.

By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which will save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame.—Civil Service Gazette.  
**JAMES EPPS and CO., HOMOEOPATHIC CHEMISTS.**  
**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA.**  
**THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—137, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S OINTMENT AND PILLS.**—Sudden changes of temperature sorely try all persons prone to Rheumatism, Sciatica, Tic Dolorous, and many maladies scarcely less painful, though of short duration. On the first attack of stiffness or suffering in any muscle, joint, or nerve, recourse should immediately be had to fomenting the seat of disease with hot brine, and rubbing in this remarkable Ointment, which will assuage the uneasiness of the part, subdue inflammation and reduce the swelling. The Pills, simultaneously taken, will rectify Constitutional Disturbances and renew the strength. No remedy heretofore discovered has proved so effective as the Ointment and Pills for removing Gouty, Rheumatic, and Scrofulous Attacks, which afflict all ages, and are commonly called hereditary.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

## NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

### Single-handed Lawn Mower.

To cut 36 inches ... ..	26 0 0
To cut 42 inches ... ..	30 0 0
To cut 48 inches ... ..	34 0 0
Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS GREEN'S PATENT STEAM ROAD ROLLER and TRACTION ENGINE COMBINED

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

Suitable for Rolling Carriage Drives, Park Roads, Walks; Rolling Lawns, Cricket Flats, Parks, &c. They can also be used as Stationary Engines for Stone Breaking, Wood Sawing, Pumping, Farm Purposes, and other various work.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Schedules on application after May 1.

Walkergate, Beverley. J. S. VICKERS, Hon. Sec.

SALES BY AUCTION.

Orchids, Lilies, Gladioli, and other Roots. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, April 21, at half-past 12 o'clock precisely, some choice SPECIMEN ORCHIDS, many of them in flower, the property of a Lady, including Aerides Fieldingii, Cypripedium hirsutissimum, Dendrobium Wardianum, Vanda tricolor insignis, Angraecum sesquipedale, &c.; several other SMALL COLLECTIONS OF ORCHIDS, including many fine plants; Specimen CAMELLIAS and AZALEAS, ERICAS, ANTHURIUMS CROTONS, APHELEXIS, PANDANUS, LILIUM LANCEFOLIUM ALBUM and RUBRUM, EXCELSUM, EXIMEUM, TIGRINUM FLORE PLENO, and NEW LILIES from Japan; Rare Hardy BULBS and ROOTS; 1000 GLADIOLUS BRENCHELEYENSIS.

May be viewed the morning of Sale, and Catalogues had. MASDEVALLIA CHIMERA, Rehb. f., discovered by M. Roelz.—Offered for the first time in Europe, and the true variety, with its flowers 2 feet in diameter. Much has been written about this species, and various kinds have been sold for it, but the true Chimera has not been imported alive before. Illustrations which have appeared give the wrong idea; this species, having never flowered in Europe, could not possibly be illustrated. M. Roelz discovered this splendid Orchid in 1871, and tried, without success and repeatedly, to get it home alive; for some eight years past his nephews have sent us almost annually, but failed in getting it in a living state to Europe, although they came personally home with them. The importation now offered is in fine condition, every plant being sound and healthy. The flower-spikes is from 1 to 2 feet long, and the flowers are produced in succession; as many as seven and eight open one after the other, the diameter between the tail ends being above 2 feet, each sepal being over 1 foot long. The marking of the flowers is deep crimson on a yellow hairy ground.

LÆLIA PEDUNCULARIS.—A most beautiful Lælia, flowers 3 to 4 inches across. It is described in the Gardeners' Chronicle, 1845, p. 839, that it is one of the most beautiful of the genus; the flowers are one deep rose colour, a little heightened at the lower part of the lip, and they droop gracefully from the end of a slender elastic scape. The unusually long peduncles add to the elegant appearance of this species. It approaches most nearly to the Lælia rubescens and acuminata. From the former it differs in the lip having none of the hairiness of that species, and its flowers being much more closely arranged; from the latter in neither its petals or lip being sharpened; and from both in its very large flowers and very long flower-stalks.

LÆLIA AUTUMNALIS.—Very finest variety, and in grand masses. EPIDENDRUM NEMORALE.—The finest exhibition species.

CATLEYA CITRINA.—In very large masses. ODONTOGLOSSUM CIPROSUM.—Grand masses with flower growths. ODONTOGLOSSUM LONDESEBOROUGHIANUM.—A very splendid importation.

MR. J. C. STEVENS has received instructions from Mr. F. Sander, of St. Albans, to sell the above, and other consignments of ORCHIDS, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 22, at half-past 12 o'clock precisely. The whole of the importations are in splendid condition. May be viewed the morning of Sale, and Catalogues had.

Cattleya superba. MR. J. C. STEVENS will sell by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 22, at half-past 12 o'clock precisely, a splendid consignment of CATLEYA SUPERBA, just received from the interior of Guiana. The specimens are in grand health, full of leaves and fine plump eyes, and the importation consists of many masses, with upwards of thirty bulbs, which will speedily make Exhibition Plants. The varieties are the very best, and the old flower-spikes show that this truly superb Cattleya makes as many as nine of its beautiful large flowers on a spike. May be viewed the morning of Sale, and Catalogues had.

Imported and Established Orchids, Cycads, &c. MONDAY NEXT.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION at the Mart, Tokenhouse Yard, E.C., on MONDAY NEXT, at half-past 11 o'clock precisely, 300 Lots of ESTABLISHED ORCHIDS, mostly from private collections, for sale without reserve, and including many rare and valuable species; a few LAPAGERIAS and FERNS; an importation of INDIAN DENDROBES, in variety; and several fine pieces of ODONTOGLOSSUM ALEXANDRE in splendid condition; together with a consignment, per s.s. Scottish Lassie, from Australia, of the rare and beautiful CVCAS MEDIA, varying in height from 9 inches to 3 feet. Catalogues had at the Mart, and 98, Gracechurch Street, E.C.

Southend. In consequence of the death of the Proprietor. The BEECH NURSERIES, about a mile and a quarter from the Southend Railway Station.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at the Mart, Tokenhouse Yard, London, E.C., on MONDAY, April 25, at 2 o'clock precisely, the beneficial interest in the LEASE of the ABOVE GARDENS, comprising 8a. 28s. of productive land, partly cropped with luxuriant Fruit Trees in fine bearing condition; 2 large newly-erected Greenhouses, with the whole of the established fruiting Vines, Peaches &c.; 3 Brick-built Cottages, Stabling, Barn, and other Outbuildings. Lease 21 years unexpired. Ground rent £30 a year. The Plants in Pots, Crops, and Utensils in Trade will be included in the purchase. May be viewed. Particulars had on the Premises, of Messrs. MONTAGUE SCOTT AND BAKER, Solicitors, 10, Gray's Inn Square, W.C.; and of the Auctioneers and Estate Agents, 98, Gracechurch Street, E.C., and Leytonstone, E.

Consignment of Orchids from Jamaica, per s.s. Mosselle, of fine pieces of BRASSIA MACULATA, ANGRÆCUM FUNALE, BLETIA FANKER-VILLÆ, BLETIA SHEPHERDII, and others.

MESSRS. PROTHEROE AND MORRIS will sell the above on MONDAY, April 26, at the Mart, Tokenhouse Yard, E.C. Catalogues as above.

Established Orchids. MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at the Mart, Tokenhouse Yard, E.C., on MONDAY, April 26, 350 lots of ESTABLISHED ORCHIDS. Catalogues had at the Mart, and 98, Gracechurch Street, E.C.

Unreserved Sale. By order of the Executrix.—Willesden, N.W. MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, on the Premises, Baker's Farm, Harlesden Green, Willesden, on TUESDAY, April 27, at 12 o'clock precisely, the whole of the GREENHOUSE and BEDDING PLANTS, including 600 Adiantum cuneatum, 500 Tea and other Roses, 250 Azaleas, 100 specimen ditto for cut bloom, 2000 Geraniums, 4000 Stocks, 1000 Pelargoniums, and quantities of other stock, together with the ERECTIONS of seven GREENHOUSES, containing about 9000 feet super. of GLASS and WOODWORK, several FITS and BOXES, a large quantity of 3 and 4-inch Hot-water PIPING, BRICKWORK, and UTENSILS in Trade. May be viewed. Catalogues had on the Premises, and of the Auctioneers and Valuers, 98, Gracechurch Street, E.C., and Leytonstone, E.

FOR SALE, the Lease and Goodwill, with upwards of 12,000 feet of Glass Erections (all heated with Hot Water), Stock and Utensils, of an old-established NURSERY and FLORIST BUSINESS, with a good Jobbing Connection—within 4 miles of Covent Garden. If required part of Purchase Money may remain at 5 per cent. Satisfactory reasons given for disposal. Apply to MESSRS. PROTHEROE AND MORRIS, 98, Gracechurch Street, E.C.; and Leytonstone, E.

TO BE LET, for Ninety-nine Years, a SIX-ROOMED COTTAGE and about 10,000 feet of Glass well stocked with Plants for Growing Cut Flowers. The Plants and Houses to be taken at Valuation. Rent £50. Apply to WM. SMITH, Beaumont Road Nursery, Leyton, Essex.

PROTHEROE AND MORRIS, HORTICULTURAL, MARKET GARDEN and ESTATE AUCTIONEERS and VALUERS, 98, Gracechurch Street, City, E.C., and at Leytonstone, E. Monthly Horticultural Register had on application.

Good Exhibition Varieties, 8s. per 100. Package free for cash with order. Also strong healthy CUTTINGS of the above at half-price, free by post. S. BIDE, Alma Nursery, Farnham, Surrey.

New Catalogue for 1880. WM. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their DESCRIPTIVE PRICED LIST on application. Their stock of Florists' Flowers, Bedding and Soft-wooded Plants generally, is surpassed by none either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to purchasers is that none of the Plants offered are taken from a warm propagating-house and sent off immediately, but are all carefully hardened, and most of them potted off singly, and are thereby fitted for transit by post or rail without the slightest injury. A great proportion of the under-mentioned are autumn-struck plants, and can be had in pots if required, and all in a variety of sorts and colours, all good for exhibition or home decoration:—

Table with two columns: 'Our Selection. Per doz.—s. d.' and 'Our Selection. Per doz.—s. d.'. Lists various plants and their prices, including Abutilons, Achimenes, Ageratum, Begonias, Bouvardias, Caladiums, Calceolaria, Carpet Bedding Plants, Carnations, Chrysanthemums, Clematis, Dactylis, Dahlias, Delphiniums, Epiphyllum, Fuchsias, Gardenia florida, Greenhouse Plants, Geranium bicolor, Geranium Silver-edged, Geranium Double, Geraniums for Bedding, Geraniums for pot culture, Gladioli, Gladioli Brencleyensis, Gloxinias, Hardy Climbing Plants, Hollyhocks, Helianthemums, Helianthemums, Hepaticas, Iresine Lindenii, Iris German, Ives, Ives, Irish, Lantanas, Lilium auratum, Lobelias, Lobelias small, Lobelias in pots, Mimulus, Myosotis, Peonies, Pansies, Pansies Bedding, Pentstemon, Phloxes, Phloxes Show, Phloxes Fancy and French, Pinks, Potentillas, Polyanthus, Polyanthus named, Primroses, Primroses Double, Primroses old Double, Pyrethrum, Pyrethrum Double, Pyrethrum H.P., Pyrethrum from ground, Pyrethrum Mosses, Rock Plants, Salvia, Saxifrage, Sedums, Sedum acre aurea, Sedums and glaucum, Stove Plants, Succulents, Tropæolum, Violas, Verbenas stock plants, Verbenas young, Violets, Vines, Vines all the leading kinds for planting and fruiting, Strawberry Runners, Apples, Pears, Plums, Cherries, Dwarf-trained, Cuttings of any of the above varieties of the Soft-wooded Plants at half above prices, our selection.

## SPECIAL NOTICE.

APRIL and MAY the best Season for Transplanting HOLLIES.

### WM. CUTBUSH & SON

POSSESS MANY THOUSANDS OF

### VARIEGATED AND OTHER CHOICE HOLLIES,

Varying from 2 feet to 6 feet, bushy, all transplanted in 1878, and will move with splendid roots.

*An inspection invited, or Prices, &c., sent on application.*

### EXTRA FINE BUSHY AUCUBA JAPONICA.

WM. CUTBUSH & SON have a very fine stock of Aucubas, well rooted, and are offering very low. Prices, Sizes, &c., on application.

HIGHGATE NURSERIES, N.; or BARNET, HERTS.

### NEW YELLOW FRENCH MARGUERITE, CHRYSANTHEMUM ETOILE D'OR.

*Awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society on the 13th inst.*

A splendid Conservatory Plant, blooming profusely all the year; flowers excellent for cutting.

Equally adapted for Bedding in the Flower Garden in Summer.

Now being sent out, 24s. and 36s. per dozen.

### W. HOWARD, FLORIST, SOUTHGATE, LONDON, N.

*Orders to be accompanied by a Cheque or Post-office Order.*

## HORTICULTURAL TOOLS & GARDEN FURNITURE.

18-in., 38s.; 20-in. 49s.; 22-in., 56s.

## MASDEVALLIA CHIMÆRA (Rehb. f.).

Discovered by M. Roezl.

Offered for the first time in Europe, and the true variety, with its flowers 2 feet in diameter. Much has been written about this species, and various kinds have been sold for it, but the true Chimæra has not been imported alive before. Illustrations which have appeared give the wrong idea. This species having never flowered in Europe, could not possibly be illustrated. M. Roezl discovered this splendid Orchid in 1871, and tried, without success, and repeatedly, to get it home alive. For some eight years past his nephews have sent it almost annually, but failed in getting it in a living state to Europe, although they came personally home with them. The importation now offered is in fine condition, every plant being sound and healthy. The flower-spike is from 1 to 2 feet long, and the flowers are produced in succession. As many as seven and eight open one after the other, the diameter between the tail ends being above 2 feet, each sepal being over 1 foot long. The marking of the flowers is deep crimson on a yellow hairy ground.

## LÆLIA PEDUNCULARIS.

A most beautiful Lælia, flowers 3 to 4 inches across. It is described in the *Gardeners' Chronicle* of 1845, p. 839, that it is one of the most beautiful of the genus; the flowers are deep rose colour, a little heightened at the lower part of the lip, and they droop gracefully from the end of a slender elastic scape. The unusually long peduncles add to the elegant appearance of this species. It approaches most nearly to the *Lælias rubescens* and *acuminata*. From the former it differs in the lip, having none of the hairiness of that species, and its flowers being much more closely arranged; from the latter in neither its petals or lip being sharp pointed; and from both in its very large flowers and very long flower-stalks.

## LÆLIA AUTUMNALIS,

Very finest variety, and in grand masses.

### EPIDENDRUM MEMORALE, | CATTLEYA CITRINA,

The finest exhibition species.

In very large masses.

### ODONTOGLOSSUM CITROSMUM, | ODONTOGLOSSUM LONDESBOROUGHIANUM,

Grand masses with flower-growths.

A very splendid importation.

MR. J. C. STEVENS has received instructions from Mr. F. SANDER, of St. Albans, to SELL the above and other Consignments of ORCHIDS, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 22, at half-past 12 o'Clock precisely.

THE WHOLE OF THE IMPORTATIONS ARE IN SPLENDID CONDITION.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

## MAKENZIE AND MONCUR,

Horticultural Builders and Heating Engineers,

UPPER GROVE PLACE, EDINBURGH, AND 43, ST. ANDREW'S CROSS, GLASGOW.

MAKENZIE & MONCUR, from long practical experience in Horticultural Building in all its branches, and having extensive Works, with the newest and most approved Steam-power Machinery, are in a position to execute all orders entrusted to them with efficiency and despatch, on the most moderate terms. They use nothing but the very best materials in Iron, Timber, Glass, Paints, &c., and have always a large staff of sober, experienced workmen in the various departments.

Hothouses of every description contracted for in any part of the United Kingdom.

M. & M. have made Heating with Hot Water a special study, and are prepared to contract for Apparatus either on the ordinary low-pressure principle with Cast-iron Pipes and Malleable-iron Boilers, or on the high-pressure principle with Malleable Tubes and Fire Coils, and will guarantee satisfactory results in all cases.

*Splendid ILLUSTRATED CATALOGUES, with more than Eighty Designs, 3s. 6d. in Postage Stamps.*

Special Plans and Specifications supplied on receipt of particulars, and Gentlemen waited upon when required.

THE PLANS of GARDENERS and ARCHITECTS CARRIED OUT.

SATURDAY, APRIL 17, 1880.

ROBERT FORTUNE.

OF all the pursuits in life by which a man makes fame and fortune none surely are more precarious and more deadly than that of a botanical collector. We need not stay now to give illustrations of this. Those conversant with horticulture and botany know the fact too well to dispute it. A walk through a nursery or well-ordered garden with some one who knows the history of the plants therein gathered together, and the career of those who were the means of introducing them, will suffice to prove what is indeed beyond dispute. This being so, of course it follows that lives so laborious, so honourable to the men, so useful to their fellows, would be duly honoured—medals and crosses would adorn their breasts, titles of honour would be bestowed on them, our universities and learned societies would be glad to enhance their own repute by paying honour to those who have deserved so well. Alas! this is what ought to be, not what is, in this country at least.

The case before us, that of Robert Fortune, is in some sense an exception. Fortune did not meet the untimely fate which befalls most collectors; his health, even, was not materially affected by his arduous labours. By his own prudence and thrift he managed to accumulate sufficient of this world's goods to banish poverty, and so far he had his reward. But of all those honours which raise a man in the estimation of his fellows, which stimulate him to increased efforts, and serve as an encouragement to others, few or none fell to the lot of Robert Fortune, the one who took so large a share in the cultivation of Tea in the Himalayas, the introducer of so very large a number of useful and ornamental plants. We can but chronicle the fact as a source of humiliation to the nation, or rather to its rulers, who have so much to give to the successful, or even unsuccessful, Briton militant, so little to the patriot whose services to the Empire are often so much more important, and so much more enduring, although, it may be, not so attractive to the general public.

Robert Fortune, whose death on the 13th inst. it is now our sad duty to announce, was born in Berwickshire on September 16, 1812, and was educated in the parish school of Edrom. Showing an early preference for gardening, Fortune served his apprenticeship in the gardens of Kelloe, the residence of Mr. Buchan, whence he went to Moredun, near Edinburgh, and after some time he entered the Botanic Gardens, Edinburgh, under the elder MacNab. Here he remained between two and three years, and in 1842 he left that city and came to London, being appointed superintendent of the hothouse department of the Royal Horticultural Society at Chiswick, an appointment he vacated on being commissioned in February,

1843, by the Society, to proceed to China to collect plants. In July of that year he arrived in China, and at once began that career of collecting which afterwards proved so fruitful. In that year began his communications to this journal, which, together with his official report in the *Journal* of the Horticultural Society, formed the basis of the books by which he is best known to the general public. Touching at Java on his outward voyage he collected a fine variety of *Dendrobium secundum*, which was afterwards sent home, and specimens distributed among the Fellows. A fortnight later he was at Macao, and thence proceeded to Hong Kong. During his stay in this island he collected *Chirita sinensis*, *Spathoglottis Fortunei*, *Habenaria Susanna*, *Arundina chinensis*, *Mussaenda*, and other plants. Finding, however, that Hong Kong and the Southern districts of China had been already ransacked, so that there was little hope of getting novelties, Fortune proceeded in the autumn of this year northward, to Amoy, which district he found more barren than that around Canton. In consequence he proceeded again northward by sea, narrowly escaping shipwreck on two occasions in the Formosa Channel. Compelled to refit, Fortune availed himself of the delay to explore the country around Chimoo and Chinchew, where, in spite of the hostility of the natives, he collected some attractive plants. After some time he arrived at Chusan. In 1844 he writes to us in glowing terms of the hills in the Chusan island covered with Azaleas, and notes his introduction of the elegant *Buddleia Lindleyana*. The scenery and botanical riches of Chusan were in striking contrast with the more southern districts, and the manners of the natives were also more conciliatory. He availed himself of an opportunity of visiting Shanghai, at that time closed to Europeans, and explored the rich plains of the Yang-tse Kiang, where, although the cultivated state of the country was generally unfavourable for botanising, he was fortunate enough to procure and ultimately send home *Cryptomeria japonica* and *Anemone japonica*, as well as many *Chrysanthemums* and Tree Paeonies. He returned to Hong Kong early in 1844, and occupied himself in packing his treasures and in transmitting them to England. At this period he revisited Canton and Macao, noting the arrival of the Moutan Paeonies, which are introduced from the north every year much as Dutch bulbs are annually imported into England. At the end of March he proceeded northward again, and was once more struck with the gorgeous beauty of the Azalea-clad mountains of Chusan, with *Daphnes*, *Wistarias*, *Weigelas*, *Bamboos*, and various other plants of great beauty and interest. At this time he visited the Tea growing district of Ningpo—his first introduction to a department in which he was destined to reap so much honour to himself, so much advantage to his country. Here he discovered in a garden the beautiful double yellow Rose which bears his name, and a curious sporting variety interesting in relation to the controversy as to the Rose called Beauty of Glazenwood. Of this sporting Rose Fortune says: "Sometimes it produces self-coloured blooms, being either red or French-white, and frequently having flowers of both on one plant at the same time—while, at others, the flowers are striped with the colours already mentioned." In the autumn of this year he returned once more to Hong Kong, to pack and despatch the plants he had collected.

In January, 1845, as it was still winter in the Northern provinces, he sailed for Manila, the general vegetation of which he states to be similar to that of Java. Here he collected a quantity of the lovely *Phalænopsis amabilis*, including one plant "with ten or twelve branching flower-stalks upon it and upwards of a hundred flowers in full bloom." In March he left Manila for Northern China once more. During the summer of this year he visited Foo-chow-foo, and the black Tea districts in the Fokien province. On the voyage from Foo-chow-foo to Ningpo the Chinese boat in which he was, was attacked by pirates on two different occasions, and had he not been well armed he must have fallen into their hands. On arrival at Chusan he was suffering from fever, but managed to proceed to Shanghai,

where, in addition to the plants he had collected in the various districts in China, he had managed to get sundry importations from Japan, and brought the whole once more to Hong Kong. Thence he dispatched half his collection, taking with him to Canton the other half. Leaving Canton at the end of December, 1845, he arrived in England in 1846. On one of his visits to Hong Kong the Governor availed himself of his services in replanting the bare hill-sides of the island. His adventures, as stated in *Men of the Time*, "were full of romance; and whether feasting with Mandarins, enjoying the hospitality of Buddhist priests, battling with the swarming natives, fighting single-handed with pirates, or gaining admission to city of Loo-Chow in the disguise of a Chinaman, he seems to have exercised equal energy and sagacity."

The results of this journey were summarised in his *Three Years' Wanderings in the Northern Provinces of China*, published in 1847, and from which we were enabled to gain much juster ideas of the populous and decaying empire that had previously been current. Chinese gardening and agriculture of course took up a principal portion of the book, and in particular the history of Tea culture was made known, Fortune having had the rare opportunity of dwelling in a monastery or temple in the heart of the Tea districts. The whole process of manufacture was examined by him, and the important fact made known that black and green Teas are both produced from the same plant—in the northern districts from *Thea viridis*, and in the southern from *Thea Bohea*—the difference in their quality depending entirely upon the manner of preparation. In this volume we find accounts of the mode of dwarfing trees, and of their system of gardening, their glorious Azaleas, their many-coloured *Chrysanthemums*, their noble Paeonies. A second edition of this volume was soon called for.

Shortly after his return to this country he was appointed, in 1846, on the recommendation of Lindley, to the Curatorship of the Botanic Garden of the Society of Apothecaries at Chelsea, and during his tenure of office set himself to work to reform that establishment. Two new houses were built, and heated on the Polmaise system, which was soon abandoned.

In May, 1848, at the instigation of the late Dr. Royle, Fortune was commissioned by the East India Company to proceed to China again, and to collect Tea seeds and Tea plants for transmission to India. He applied for two years' leave of absence to the Apothecaries' Society, but as this could not be consistently granted Fortune resigned his appointment, amid expressions of regret and goodwill on the part of his employers, and proceeded once more to China.

In 1849 we read of his success in collecting Tea plants, and in 1850 he communicated to our columns his discovery of a primrose-yellow *Canellia*, and his description of the graceful *Cupressus funebris*. Several of the plants collected in this journey were transmitted to Mr. Standish for distribution.

In 1851 we read of his arrival in Calcutta with nearly 2000 young Tea plants and 17,000 germinating seeds; with these he proceeded to the North-west Provinces of India, and thus served to lay the foundation of what is now a lucrative industry.

In 1852 he paid a second visit to China, in the service of the East India Company, and during his journey supplied these columns as heretofore with particulars of his travels. He made known to us the simple expedients by which the Chinese force their flowers for early spring use, making use of sheds with the crevices filled with straw, and the heating apparatus consisting simply of a charcoal stove. The Kum Quat, *Citrus japonica*, the *Chrysanthemums*, the *Cryptomerias* and *Cunninghamias*, all attracted his attention, and furnished him with materials for graphic description. Were labour sufficiently low-priced, says Fortune, Tea might be cultivated even in Ireland.

In 1853 appeared in our columns the "Leaves from a Chinese Note-book," full of interesting details of Chinese gardens, in particular that of How Qua, known to tea drinkers. The account of this gentleman's garden will be found at p. 631 of our volume for that year, and is specially

worthy of notice. The account of the spring flowers in the north of China, *Jasminum nudiflorum*, *Spiraea prunifolia*, *Daphne Fortunei*, various Peaches, *Viburnum macrocephalum*, *Weigela rosea*, may be mentioned among others by way of illustration.

Near Ningpo Fortune met with one of those curious cases of mock grafting of which he subsequently furnished us a sketch, here reproduced (fig. 86). In the course of his wanderings he met with a Juniper, such as the Chinese are fond of planting round their graves. "But although a Juniper at the top and bottom, an evergreen tree with large glossy leaves, *Photinia serrulata*, formed the centre." The *Photinia* came out from the trunk of the Juniper about 12 feet from the ground, and appeared as if it had been grafted upon it. And such was the belief of the natives, but on examination it proved that the *Photinia* was rooted in the ground, and had 12 feet of its stem cased in the trunk of the Juniper.

In this year he visited Formosa, of which so little was then known, and, indeed, of which so much still remains to be discovered; there he found abundance of *Lilium japonicum*, and the now well-known Rice-paper plant, *Aralia papyrifera*.

In 1855 he writes us a long description of the beautiful Golden Larch, *Abies Kaempferi*, and of the locality where it was growing. Subsequent letters contain details concerning the Chinese Yam, *Dioscorea Batatas*, the Mosquito Tobacco, the hardiness of Chinese plants in England, the dreadful consequences of the Rebellion, as seen in the destruction of forests, gardens, houses, &c., near Shanghai.

In 1857 appeared another work from Fortune's pen, entitled, *A Residence among the Chinese, Inland, on the Coast, and at Sea*. Here we have a *resumé* of his travels in the Tea districts of Chekiang (second visit), Shanghai, Canton, Foo-chow-foo, and Formosa. Subsequently he visited the cooler districts of China, including the silk districts, where he carefully observed the whole process of silk manufacture. The book goes on to record his second journey to India and his return to England.

In 1858 he again proceeded to China, in the service of the American Government, and in 1859 he was awarded a medal by the Paris Société d'Acclimatation, in acknowledgment of the number and value of his introductions.

In 1861 he writes to us from the Yang-tse Kiang River in China, detailing the results of his visit to Japan. These letters are full of descriptions of Japanese scenery, manners and customs, visits to nurseries, and botanising excursions. He notes the fondness of the Japanese for variegated plants, and gives (p. 577, 1861) a list of some of those procured by him and despatched to this country. In a subsequent letter he mentions the Japanese *Chrysanthemums* (p. 773, 1861), of which he says:—"If I can succeed in introducing these varieties into Europe they may create as great a change among *Chrysanthemums* as my old protégé, the modest Chusan Daisy, did when she became the parent of the present race of Pompons."

In 1862 Fortune returned from Japan and Northern China, bringing with him various specimens, amongst other things an *Artemisia* used as a stock by the Chinese whereon to graft the *Chrysanthemums* as standards.

In the following year (1863) appeared a book descriptive of this his fourth and last journey to Japan and China, under the title of *Yeddo and Peking: a Narrative of a Journey to the Capitals of Japan and China, with Notices of the Natural Productions, Agriculture, Horticulture, and Trade of those Countries, and other Things met with by the Way*. This book, like its predecessors, is remarkable for the picturesque natural way in which he describes what he saw.

Thus ended the wanderings of this keen botanist and most persevering collector. What we have said must be taken as a mere outline of his work. Our space will not permit us to do more; nor, indeed, is it needed, for the narratives of his travels are in every well-furnished library; and as to the plants he introduced, many of them are now so well known and so thoroughly appreciated, that it is hard to think

the name and services of Robert Fortune can be forgotten.

Fortune formed one of the Committee of the International Exhibition of 1866, but from that time gradually retired from horticultural pursuits, and betook himself to farming in Scotland. Nevertheless, he occasionally came among his old friends and companions, and only quite recently revived old associations by communicating to us a list (incomplete) of the principal plants introduced from Japan and China by his agency (see p. 11).

To those who are inclined to forget what the Horticultural Society has done for horticulture, it may suffice to mention that through its auspices Fortune first made his mark as a botanical collector, and many of his choicest plants were sent home by him to the Society.

areas, in which one special plant or series of plants is done better than perhaps anywhere else. Now it is Orchids, again it is Lilies; here it may be Fuchsias, there Pelargoniums; in another locality it is stove plants, and in yet another greenhouse plants. In the particular district referred to, there are several specialities of culture, and prominent among others is that of Gardenias. The three clever and well-known gardeners, Messrs. Irvine, Keen and Mill, may be said to be running a Gardenian race, and without saying which has won, which would seem invidious and would be useless, I purpose describing the simple means which they all adopt in common, and which appear to form the foundation of their success. These are the employment of young plants, continuous growth and flowering, planting out, abundance of heat and moisture, the use of rough peaty soil and gritty sand,

a mistake to rest Gardenias, and it is one that often proves fatal. It is during this forced rest that they so often get out of health. This I know well from experience. I crippled the finest lot of plants I ever had by attempting to keep them back for a special occasion. Many of the flowers dropped off when the plants were subjected to a higher temperature, and none of them ever recovered their lost health. But it is only needful to notice the mode of growth and flowering of Gardenias to be convinced that the plants thrive best and flower freest when kept always at work. Flowering and growth are simultaneous, and it follows that under favourable conditions the two will run abreast, as it were, in continuity. And they do. Under liberal treatment Gardenias go on flowering throughout the greater part of the year. They also grow fastest and flower freest when planted out. Gardenias are free, almost gross, rooting plants; they are often literally starved in pots—the soil gets sodden on the top and dry underneath, and the roots perish or the plants starve. Planted out the roots have a wider range, and the plants thrive with a luxuriance, and grow and flower with a vigour, seldom witnessed in pots.

Gardenias also require abundance of heat and moisture. The old cultivators had a saying, that dry heat was essential to the successful culture of Gardenias. The finest of those met with had no bottom-heat, neither from dry nor hot-water pipes. Some of those seen, however, though by no means the best, had bottom-heat. In all other respects the top temperature and treatment were the same—from 65° to 75°, with a semi-saturated atmosphere, were the atmospheric conditions provided. Frequent and heavy syringings were also given for the double purpose of maintaining a sufficiently moist atmosphere, and keeping the plants free of mealy-bug, for experience is daily proving that there is no remedy for this mealy pest equal to the cold-water cure, which was, I believe, first propounded by myself in your pages. Gardenias also prefer peat and sand only. I have seen them well grown in the usual regulation mixture of half peat and half loam; some also prefer leaf-mould, and even a small portion of thoroughly decomposed cow-dung; but on the whole nothing seems to suit them like rough lumpy fibry peat with about a sixth portion gritty sand and a sprinkling of smashed charcoal. The drainage should be ample, as it is almost impossible to over-water Gardenias when they are in full growth. Nevertheless, they quickly resent stagnant water at their roots, and hence the necessity for liberal drainage.

A mass of soil 18 inches or so wide along the centre of the pit or bed, and 2 feet deep, will, however, grow magnificent plants of Gardenias a yard high and as much through. When the roots come through the soil to the surface it is easy to top-dress with a few inches of fresh earth. This can hardly be pressed too firmly against the root-filled mass of old soil, and the plants speedily occupy the fresh feeding ground, and go on growing and flowering the better and the longer in consequence.

Our last point—and it is one of immense importance—is the gathering of each flower separately. This seems a small matter, but as each flowering branchlet breaks into three or more shoots above the flower—and these shoots form succession flowers—it follows that for every flowering shoot cut off three or more flowers are lost to the plant. Hence the importance of gathering each flower singly, and never cutting a branch. The flowers may be mounted with other foliage, such as the broad-leaved Myrtle, small leaves of the Sweet Bay, Portugal Laurel, Ferns, Lycopods, &c. Those who insist on having Gardenia foliage, which undoubtedly is the best—every flower should, in fact, be garnished with its own leaves or branchlets—should grow a few plants in pots for this purpose; but every cultivator who aims at the richest harvest of blooms from his specimen Gardenias should lay it down as an unalterable law, that no shootlet or branch shall be cut off. The plants break back readily enough, but such breaks seldom flower within reasonable time, whereas the terminal shoots, after making a few joints of wood, speedily mature blossom-buds, and thus a sure and plentiful succession of flowers is kept up. *D. T. Fish.*

AGAVE REGELII MACRODONTA.—A noble specimen of an Agave bearing the name of A. Regelii macrodonta is flowering for the first time in Mr. J. T. Peacock's collection in the Temperate-house at Kew. Mr. Croucher looks upon it as a large form of A. horrida.

FIG. 86.—MUCK GRAFTING AS PRACTISED BY THE CHINESE. (SEE P. 488.)

As to Fortune himself, he is one of those whose name can never be mentioned by the gardener or the botanist without feelings of respect, admiration, and gratitude.

## THE CULTIVATION OF GARDENIAS.

In a recent run through East Suffolk I was much struck with the exceptionally healthy condition of the Gardenias seen at the Duke of Hamilton's at Easton, Mr. Shepherd's at Campsy Ashe, and Lord Rendlesham's at Rendlesham Hall. This high excellence of particular plants in special localities is one of the peculiarities of horticultural practice. Within the wide range of horticultural practice one is constantly meeting with what may be called smaller circles or

and the gathering of the flowers singly, instead of cutting the branches.

I found all my good friends to have the most boundless faith in young plants. As far as I could learn, none of their large plants, laden with their rich sheets of white sweet blooms, exceeded two years old. A few cuttings are struck every year. These are pushed on rapidly until they fill 6 or 8-inch pots, when they are planted out. They are left to flower twelve, fifteen, or eighteen months, and then removed to give place to young plants again. By this constant renewal of the plants they are always maintained in the full vigour of growth. When practicable two small houses or pits are employed—one succeeding the other; by this method a blank of any duration seldom occurs in the supply of Gardenias. But this brings us to the second point of what, for convenience, I may call the East Anglian mode of culture. It is

## HARDY CYPRIPEDIUMS.

THERE is no reason why a still greater number of our plant-loving amateurs should not gratify their taste by cultivating a goodly number of Orchids, although they may not possess warm or cool glass-houses.

There are in the Orchid family very many handsome species which, if cultivated under favourable conditions, are perfectly hardy. I cannot give the exact number of species and varieties which are *bonâ fide* hardy plants in our ever-changing climate, but there are at least representatives in typical species, to say nothing of varieties, of twelve genera, and if we include *Disa*, which is hardy in the south-west, that gives us another genus. To the amateur botanist who does not disdain the gorgeous, as well as the structurally curious, such an array of genera which represent well the differentiation in the Orchid family should certainly be an inducement to cultivate them, especially now that we have learnt what great interest attaches to Orchid flowers. As to the *Cypripediums* which are the subjects of this short paper they are among the most beautiful and most interesting. All who know the hardy species of this genus must admit their great beauty; in fact, as far as floral colouring goes, they are even more beautiful than most of the numerous exotic species grown in our stoves. Take, for instance, *C. spectabile* when in good order; it is certainly as showy as any of the species.

## CULTIVATION.

Some Orchid growers recommend frames for their successful culture, with which I agree *in toto*, but at the same time they may be successfully cultivated without a frame. It is advisable where sufficient stock is at hand to grow them in a frame in pots or pans, and in a border outside as well. This will afford a double amount of pleasure to the cultivator. If grown in a frame they only require potting and tending as other Orchids; but if we are to grow them outside there should be a shady border selected—I do not commend excessive shade—from which the soil should be removed about 15 or 18 inches, placing a layer of drainage about 6 or 8 inches deep, when the hole should be filled up with good peat and pure leaf-mould, about one part of the latter to two of the peat, adding a good supply of sharp sand, and then the bed is quite ready to receive the plants. Probably the best time to plant is about March or April. I might add that if the position is damp so much the better, as they prefer moist places; and in the summer they must not be allowed to become dry, or the flowering force for the following season will be scanty. They must not be planted very deep, say about 2 inches under the surface, as it is better to give them a slight protection during the winter than to plant them deep. The back part of the border may be planted with the peat-loving *Liliums*, such as *L. canadense*, *superbum*, &c., which will be equally at home in such a bed, and when in flower will give a stately and beautiful appearance to the bed. Many plants also might be selected to carpet the bed, such as *Erpetion reniforme*, which, however, is rather apt to suffer in severe winters; *Linaria pilosa*, or *Wahlenbergia hederacea*, all of which are rapid growers and very pretty, while there are many others equally as good; and we must not forget that there are numerous other pretty hardy Orchids which might also be planted if there was sufficient room. I shall notice them another time, confining myself for the present to the *Cypripediums* which are enumerated below.

*C. ACAULE*.—A beautiful small-growing North American species, at once distinct from the rest; the flowers are very large, quite 2 inches or more long, issuing from a pair of large opposite, ovate, hairy leaves, which are supported on stems 6 inches high. The colour of the flowers is variable; usually they are beautiful rose, sometimes shading to white. This is one of the easiest to grow in such a border as described above, or it does in a shady position on any rock-work with soil as recommended. Flowers in June.

*C. ARIETINUM*.—This is commonly known as the Ram's-head Lady's Slipper, although the resemblance is not close. The stems are very slender, from 4 to 6 inches high, copiously leafy, with a single flower at the extremity; the sepals and petals are greenish brown, while the labellum is white freely veined with red. This is a rare species and requires a very damp situation, which, if not in the border, must be supplemented by a good supply of water. It is a native of North America, flowering with us in May.

*C. CALCEOLUS*.—This is a British plant, but rarely met with. It is a beautiful species, and must

be placed with the cream of British plants. It grows about 9 inches high, with slender stem bearing several ovate-oblong hairy leaves; flowers from one to three on each stem, with brownish-purple sepals and petals, and a bright yellow round lip. It is not difficult to grow but rather uncommon; it is, however, to be secured from our best collections. It enjoys a moist place. Flowers in June.

*C. JAPONICUM*.—This is a very uncommon species, and quite distinct from all others. The stems are from 6 to 12 inches high, supporting two large roundish cordate leaves, with crumpled edges of a light green colour and pubescent. The flower, which is always solitary, issues from between the leaves, with greenish sepals covered with red spots; the petals and labellum are white, stained and tinged with crimson, forming a lovely contrast of colours, and it lasts a considerable period in beauty. This does also well in the border. Native of Japan, flowering with us in June.

*C. MACRANTHIUM*.—This is the large-flowered Lady's Slipper, as its specific name implies. It is a native of Siberia, and has been introduced into the country ever since the beginning of the present century, but was almost annihilated until recently, when it has been imported rather freely. I should advise purchasers, however, to secure it while they are sure it is correct, as I have once had *C. Calceolus* sent to me for it. It is one of the finest in the group. Stems usually a foot high, producing one to several large flowers from 2 to 3 inches in length, of a rich purplish-red colour. It is a strong grower, and will flourish well if planted in a damp place. Flowers during May and June.

*C. MONTANUM*.—This species is by no means common, being comparatively of recent introduction from the Rocky Mountains. It is a strong growing plant, producing stems 15 or 18 inches high, with large ovate-lanceolate hairy leaves, flowers solitary, with deep brown sepals and petals, while the labellum is much inflated, white, tinged with red. This is a very striking species, and well worthy a place in any Orchid collection.

*C. PARVIFLORUM*.—This is a strong growing North American species, which has been introduced into this country over a century, yet is but little known at present. The stems grow from 18 to 24 inches high, copiously foliaceous; flowers one to three on a stem, with sepals and petals brownish-purple, and the labellum bright yellow; the flower as well as being very showy is delightfully fragrant. The size of this species depends upon the position it occupies; if favourable it will grow to the height described above, but I have known it to grow only a foot high. It revels in moisture. Flowers in June.

*C. PUBESCENS*.—This species has also been introduced about a century, from the same part of the world. The stems are from 1 foot to 18 inches high, with large very pubescent leaves. Flowers precisely similar to those of *C. Calceolus*, but larger; in fact, the plant is altogether like that species but more robust. It is most likely a variety of *C. Calceolus*, differing through the place of growth. It is, however, a very beautiful plant. Flowers in June or July.

*C. SPECTABILE*.—This is unquestionably one of the finest hardy plants in cultivation, and as a species of the Orchid family surpasses in beauty many of the exotic forms which are universally esteemed. It grows when in good health, and cultivated under favourable circumstances, from 18 to 30 inches high, with leafy stems, the leaves being ovate-lanceolate and pubescent; the flowers are 2 to 3 inches across, with white sepals and petals, while the labellum is more or less rose-coloured, sometimes delicate, or deep and much inflated. It requires a copious supply of moisture when growing, and when once established, which it readily is, presents a grand appearance. It is happily employed at Kew mixed with the hardy Ferns, where the flowers are very effective.

Before leaving the subject I may add that it is not absolutely necessary to prepare a special border for these plants, although such a method is decidedly best, as they may be planted on the rockery in suitable soil, but the position must be shady; and they may also be planted with hardy Ferns. I have seen them very beautiful, when planted in hollowed-out tree stumps, where they receive drainage and partial shelter. *A.*

## EREMURUS ROBUSTUS AND TURKESTANICUS.

NOTICING some notes in recent *Gardeners' Chronicles* regarding these plants, I venture to mention my experience with them. In the fall of 1877 we received a bulb of each from Max Leichtlin, Baden Baden. We potted and kept them in a cool greenhouse till the spring of 1878, when I planted them in an outdoor and sheltered rockery. They grew strongly, and *E. robustus* flowered in June, when it bore a scape 6 feet high; it also ripened lots of seeds.

Inspired by the possession of plenty of seed, and knowing no reason why they should not be hardy, coming, as they do, from the home of so many hardy plants, I left them out over winter, but covered them up pretty well. The next spring (1879) they emerged stronger than before, and in June both were in blossom. *E. robustus* was grand. Its flower-scape was 8 feet high, terminating in a dense raceme  $3\frac{1}{2}$  feet long, containing over 400 pale pink flowers, of which 120 to 140 were in bloom at one time. Each blossom measured about  $1\frac{1}{2}$  inch across. When in flower it is remarkably handsome, and the most striking plant I know of. It ripened lots of seeds last year, too.

*E. turkestanicus* is by no means such a strong-growing or ornamental species as *robustus*. It starts earlier into growth, and is done blooming (it flowered during the last week in May and the first week of June) by the time its gigantic relative begins. It bloomed with us last year. Its flowers were dark red and brown, on a 16 inches long raceme, terminating a scape 4 feet high. Several seed-vessels formed, but no seeds ripened.

Both plants have been left undisturbed, and I noticed yesterday (March 29) that, solidly fastened in the frozen earth, their crowns are at the surface of the ground, plump and healthy-looking, and instead of one crown, *E. turkestanicus* has several. I did not cover them up much this winter; merely placed a piece of board over their crowns, to ward off rain and drip, and over that a little sedge-grass. And I am now convinced a slight covering is better than a heavy one, because this year the plants have not started into growth so early as they did last, and that is a decided advantage in our severely changeable spring weather. But at planting time I made a mistake. I did not plant them deep enough; the settling earth in the rockery, the washing by rain and heaving by frost, have left the bulbs almost at the surface of the ground.

Now as to their hardiness. Our two last winters have not been steadily severe, but they have been very variable, and a few times each season the thermometer indicated some degrees below zero, Fahr. The winter of 1878-79 was exceptionally destructive to herbaceous plants; this (1879-80) comparatively open till this month (March), which has been cold and stormy. I do not winter-cover our rockeries till they are well frozen; and in that way I can preserve them from thawing till February or March, and in shady places till April. *Wm. Falconer, Botanic Garden, Cambridge, Mass.*

## New Garden Plants.

ANTHURIUM ANDREAANUM.\* (See fig. 88, p. 497.)

This is the very striking plant which we noticed last week as having been exhibited at Ghent, where it attracted much interest. A similar feeling was experienced here when the plant was shown before the Floral Committee of the Royal Horticultural Society. The plant is an Aroid of tufted habit, with oblong, cordate, glabrous, leathery leaves, dark green above, paler beneath, and marked by comparatively few but prominent nerves; the leaf-stalks are ascending, cylindrical, slender, and thickened at the top, the blade being attached, as it were, hinge-wise, so as to allow of varying positions, deflexed or spreading. The flower-stalk is double the length of the leaf-stalk, erect, slender, and bears at the summit a spreading, heart-shaped, acute, leathery spathe of a brilliant shining scarlet colour, the surface irregularly corrugated, like the cartilage of the ear, and of so firm a texture and brilliant a colour as to suggest the idea of an artificial rather than of a natural production. The spadix, which is about 3 inches long and of the thickness of a swan-quill, is ivory-white at the base, greenish-yellow at the tip. The plant is a native of New Granada (province of Chocó), where it was discovered by M. André, and by him introduced into M. Linden's establishment.

Mr. Worthington Smith's drawing gives a good idea of the plant, for a full technical description of which we refer to Dr. Engler's monograph, cited below. It is included in the section *Cardiophyllum*. Undoubtedly the plant is one of the most brilliant and remarkably introductions of recent times. The figure given in the *Illustration Horticolæ* in 1877 was taken from dried specimens, and by no means does justice to the plant. Those who remember what *A. Scherzerianum* was on its first introduction and what it is now are justified in looking forward to the career of the present plant as likely to be of quite exceptional importance. M. André saw it for the first time growing on the forks of an immense Indiarubber tree, *Ficus elliptica*, when he mistook it for the Cardinal-bird (*Loxia*), but subsequently found other specimens growing on the ground. The cultivation of the plant is likely to be easy. *M. J. M.*

\* *Anthurium Andriaeanum*, Linden, *Illustr. Horticolæ*, 1877, p. 43, t. 271; Engler, in *D.C. Mon. Phan.*, vol. ii., *Gracæ* (1879), p. 163.

## THE YORK NURSERIES.

THE nurseries of Messrs. James Backhouse & Son at York may almost be said to be too well known to need description, but in nurseries of such large extent as these there is always something of an interesting character to notice, something to please and to instruct. Besides the usual run of nursery stock required in a large business, there are here a few specialities that are not seen so good anywhere else. There is also a rather large collection of Orchids, and the firm has introduced some high-class novelties; amongst others may be mentioned the quite recent *Odontoglossum Londesboroughianum*, of which there are some enormous masses starting into good growth. Worthy of high commendation, too, are the many fine varieties of *O. vexillarium*. Messrs. Backhouse were fortunate in introducing many fine varieties of this splendid *Odontoglossum*, some of which were sold at Stevens' Rooms last year, and realised from 25 guineas to 30 guineas each for very moderate-sized plants; the immense size of the flowers and their rich colours being the reason that such high prices were realised. At present there are a number of well grown examples in flower, some of the flowers quite 4 inches by 3 inches. *Bollea cœlestis* is an Orchid not too well known; it was introduced only a few years ago, and promises, when well-established, as it has been in some gardens, to be a very distinct and attractive species. It does well in the York Nurseries in the same house with *Odontoglossum vexillarium*, in a temperature of about 60° at night. In the cool-house I noticed a very richly coloured form of *Masdevallia Harryana*. *M. Backhousiana* had a few very fine flowers; this species seems to be very near *M. Chimæra*. I noticed that slugs were kept from the flowers by a thin strip of silk wound round the stem.

Filmy Ferns have special attention paid to them. There are two small houses filled with specimen plants in good health, and very interesting they are. Although the plants were exposed to very low temperatures during the late severe winter they look none the worse now. *Todea superba* had been subjected to 15° of frost; *Trichomanes reniforme* is a very distinct species, and stands frost well; *T. trichoidem* is a very pretty, finely-cut, graceful species with slender fronds; *T. umbrosum maximum* has long fronds, which are very beautiful; *T. Luschnathianum* is also very graceful and pretty, climbing up earthenware stems; *T. auriculatum* clings closely to these stems, and its drooping transparent fronds, not unlike *Asplenium marinum* in shape, are very distinct. *T. meifolium* is perhaps the most graceful of all, its very slender fronds are exceedingly pretty. *Hymenophyllum demissum* var. *nitidum* is an improved form of the species, and *H. crispatum* is very distinct. Noticeable in one of the houses is a group of plants of a greenhouse Fern that should be in every collection — *Lomaria L'Hermieri*; it soon forms slender stems, crowned with a tuft of fronds, the young ones being quite of a crimson tint.

But the glory of the York Nurseries is the rock garden. Though it has been laid out at a great expense, the money has not been wasted, as often happens when works of this kind are undertaken. The plan must have been well thought over before it was worked out, and the result has been eminently successful. Here we have a natural system of rock and water combined, so that plants preferring dry localities find what is best adapted for them, and moisture-loving subjects revel in the enjoyment of moist peat or loam, as the case may be. At present the hardy species of *Primula* are most interesting, and they look quite at home in different positions amongst the rocks. Here are *P. viscosa nivea*, usually known as *P. nivalis*, which is wrong, as the name *P. nivalis* belongs to another species with purple flowers. *P. marginata* grows very freely, speedily forming large masses; its rosy-purple flowers are very pleasing. *Primula Auricula marginata* and another variety named *Balbisiana* are much superior to the normal forms of the wild *Auricula*. They have been gathered in a wild state by Mr. Backhouse's collectors: the flowers are quite golden. *Primula ciliata*, deep crimson with yellow eye, deserves great prominence. I also noticed *Primula pubescens*, mentioned in the *Gardeners' Chronicle* last week. *P. Dinyana* must also be noted as a desirable species to grow. Of *P. spectabilis* there are large healthy masses growing in places where the loam is deepest; this species at once attracts with its trusses of purplish-rose flowers, of which eight or nine can be counted on a truss. *P. pulcherrima* and *P.*

*cashmiriana* are growing in patches of a dozen or more plants together, and the different shades of colour enhance their interest and beauty. However, the most striking and beautiful of all is *P. rosea*; it has been abundantly planted, and in different positions, but its home is evidently in the interstices of the rocks, where it is growing and flowering very freely indeed, and the colour is more intense than any I have yet seen. Growing in pots under glass, the flowers are flimsy and washed out: this I have proved in our own garden, as I did not see it under glass at York.

All the *Soldanellas* were in flower, and if they are amongst the smallest they are also the most beautiful of alpine. *S. montana* has pretty lilac-purple flowers in umbels and deeply fringed. *S. alpina* had fewer flowers on an umbel, of a deeper purple and beautifully fringed. *S. minima* was also in flower; it is similar in structure to the others, very small, and had pale rose flowers. *Saxifraga pyrenaica* is said to be a very pretty species, but it was not in flower. *S. retusa* was in flower, and is very pretty. The *Androsaces* are also in flower, and amongst them *A. carnea* is very pretty. *A. tomentosa* is not yet in flower, but it succeeds well in open places. *Viola hirta* flowers very freely, and is very conspicuous even at a distance, but it lacks fragrance. Of the beautiful *Hepatica angulosa* there are very large masses; fancy the effect of one when in flower nearly a yard across. *Anemone blanda* had formed very large masses, and its deep sky-blue flowers are very striking; it comes near to *A. apennina*, of which it may be a variety. This was introduced by the firm from Greece a few years ago, and it should be grown as extensively as *A. apennina*.

In sheltered rather shady positions are to be found numerous examples of *Meconopsis nepalensis*, which had formed fine flowering specimens. *M. aculeata* had flowered very strongly last year: this, like *M. nepalensis*, was thought to be biennial, but it is not so, as the plant proves itself to be perennial under the shady side of a ledge of rock here. *M. Wallichii* is also starting into vigorous growth.

Last, but not least, are the *Sarracenias*. With the glass down to 5° Fahr. thermometer, *S. purpurea* has stood well, and even *S. Drummondii* is sound at the crowns, as also is the *Cephalotus follicularis*. It is interesting to know that these remarkable plants are quite hardy in the coldest districts. *J. Douglas, Lovford.*

## ANNUALS FOR POT CULTURE.

EVANESCENT as most of the annuals are, especially many of those generally cultivated in the open borders, there are some that are almost indispensable for pot culture, chief among which are the *Celosias*, the inflorescence of the best strains being of a peculiar plume-like character and producing a most pleasing and striking effect. Not only are they most valuable for general decorative purposes, but they are equally serviceable for supplying cut flowers, the rich feathery appearance of which renders sprays of it exceedingly telling in any vase, where, if judiciously used so as to droop over the sides, it imparts a fine finish. To have plants of *Celosias* in good condition by about the end of July, seed should be sown at once in fine light soil, and placed in moist heat, where it will soon germinate, and the seedlings become large enough for pricking off or potting singly in small pots, to be nursed on again in a warm, genial atmosphere, till they are fully established. There is no place better suited to grow them in than an ordinary dung-frame, the vapour continually rising in which keeps down red-spider, an insect they are very subject to during the summer months, but by having the plants in a place to themselves, these pests may be easily prevented from doing any harm to the foliage.

*Celosias*, being naturally pyramidal and branching in their habit, require no stopping or training, and all that is necessary to get well furnished symmetrical specimens is to afford them plenty of room in order to admit full light and sun between, which, with the proper amount of air, induces sturdy stems, and enables them to stand and maintain themselves erect without any support. Although the plants delight in rather strong heat during their early stages, they stand well afterwards in the ordinary temperature of a greenhouse or conservatory, where, if placed out of reach of draughts, they form handsome ornaments, and maintain their full beauty for months. To keep up a succession and have others to come on in the

winter another sowing should be made in August, plants from which, if stood in a warm dry stove late in the autumn, will yield flowers continuously till long after the turn of the year. The soil best adapted for the culture of *Celosias* is a mixture of loam and leaf-mould in about equal proportions, in which the roots ramify freely; and as the pots fill with these liquid manure will be found of great assistance to the plants in producing good heads of bloom. The most desirable kinds to cultivate are *plumosa coccinea* and *plumosa aurea*, the two sorts yielding many shades of colour; but to keep up a pure stock of the most feathery of these and preserve a strain worth having it is necessary to select such as show the greatest merit to save seed from, otherwise they soon degenerate, and the plants revert more or less, and often in a considerable degree, to the old stiff-looking Cockscomb.

Next in point of merit and usefulness to *Celosias* come *Balsams*, which have been so much improved of late years, that it is no uncommon thing now to see them with flowers almost as large as a *Camellia* and as beautifully striped as a *Carnation*; but the worst of it is, these very double blooms set but few seeds, and this makes them somewhat scarce and dear at starting. Such superior strains, however, are always worth all they cost, as compared with them others look mere weeds, and are scarcely worthy the trouble of potting or house-room. *Balsams*, like most other soft sappy-stemmed quick-growing plants, have a great tendency to rush up and become attenuated when grown under glass, to check which it is necessary to have them well up to the light from the moment they appear above the soil till they get into bloom. During their early stages, a shelf near the glass suits them best, and as they gain size a pit or house where they can be plunged in a little bottom-heat and kept fully exposed to the sun. This with plenty of air will induce a close short-jointed habit, and cause them to send forth such robust side shoots as to render the plants well furnished throughout.

Being very gross feeders, the soil in which *Balsams* are grown can hardly be too rich, and if the manure used be of a mild nature, such as that from an old hotbed, and thoroughly decomposed, a third of it with the loam will not be too much. The two ingredients before using should be thoroughly incorporated, and in potting, to get the plants as stocky as possible, they should be dropped a little lower at each shift, till at last the bases of the two bottom branches are brought on a level with the soil. To force these in a horizontal direction it is often necessary to give them a peg or tie them down: by doing this the foundation is at once laid for well furnished specimens. The size of the pot will depend on the dimensions it is desired to secure; but fine plants fit for most purposes may be grown in those of 9 inches or a foot across, as when they become filled with roots liquid manure may be given in any quantity provided it is not too strong. The drainage from cow-yards or dunghills suits best; but any of the artificial stimulants answer the purpose if given weak and often, the danger of these being an overdose, as from their concentrated form most of them have to be used with great caution. In saving *Balsams* for seed it will be found that they set and ripen better by being placed out in a south border, but before doing this they must be properly hardened off, and always kept well watered afterwards. As the pods burst as soon as ripe and disperse the seed, they require watching and picking when fully grown, and if laid in pans in some dry place they soon become sufficiently hardened for storing.

Another very beautiful annual for pot culture is the *Schizanthus papilionaceus*, the flowers of which, as its trivial name implies, resemble butterflies, and this not only in shape and form, with outspread wings, but in some of the most peculiar and lovely markings of these much admired insects. Some idea may therefore be formed of the fine display they make in a house when in full bloom, and what an acquisition they are for general decorative purposes during the summer. Seed obtained at once and sown in gentle heat will afford plants that will be in perfection by the end of June or July, and another sowing made in either of these months will give another batch to succeed them in the autumn. The latter lot will be found to do best plunged in some open sunny spot out-of-doors, but those started now must have the protection of a cold frame for a time, when they, too, will be benefited by a little exposure, as they always grow more dense and lushy treated in this way, and are more floriferous than when kept

under glass. The way these *Schizanthus* look best is by growing three in a 7 or 8-inch pot, as singly they have rather a spare look, their habit being somewhat thin and fragile, but three together form a fine mass if placed triangularly near the sides of the pots. *Schizanthus retusus* Grahmi is equally desirable as the above-named, the flowers of this variety being exceedingly handsome, resembling some of the choice Orchids in their formation and markings. Like most annuals, they are both fond of light rich soils, and require a free supply of water when growing and carrying their bloom.

Rhodanthes, again, are perfect gems for the embellishment of greenhouses and the adornment of window recesses in rooms, for the latter of which purposes they are held in high estimation in our cities and towns, where the sale of them is something enormous. Being rather tender and delicate when young, they require a little heat at starting, such as may be afforded in a dung frame, from whence they may be transferred to any light shelf at the back of a pit till they come into bloom. Refuse peat, or soil containing a good proportion of leaf-mould, suits them best, in which they should be potted three in a 5 or 6-inch pot, and the points of the shoots of the plants nipped out once so as to cause them to branch out and furnish better than they otherwise would.

Gomphrenas, being of much the same nature and general character as the Rhodanthes associate well with them, and are plants worth growing, as they, too, form bright cheerful looking objects, and are very distinct among others. The flowers of both being dry, are very durable and exceedingly ornamental in a cut state mixed with other everlastings and grasses—an arrangement that is both pleasing and beautiful, and groups so formed look fresh and attractive the whole winter through.

Salpiglossis is another annual well deserving of pot culture, as although it may be grown in beds or borders outdoors it is only seen in perfection in warm summers. A packet of seed affords endless variety, as scarcely two plants in the lot yield flowers exactly alike, the rich ground and markings of some being most striking. In size and form the blossoms bear a close resemblance to those of the Lily, and it will therefore be seen how ornamental they are.

The old *Martynia fragrans* should not be forgotten, as it is as useful for greenhouse decoration as anything that can be had; and the great merit of all these annuals is that they can be got up quickly without much expense or taking up glass room that is valuable for other purposes, as they can be stood in the open the principal part of the time they are growing. J. S.

## GARDEN GOSSIP.

BY A LADY.—NO. IV.

THE DAFFODIL.—Those to whom this name is only associated with the common double Daffodils of cottage gardens must have some difficulty in appreciating the fitness of the title "fair" which Herrick bestows on them in his well-known poem, or their old name of "Lenten Lilies;" for certainly the golden balls of the double Daffodil but little resemble Lilies. But in Herrick's time the wild Daffodil must have been much more common than in these days of high cultivation, when farmers ruthlessly exterminate it as a noxious weed; and probably it was the only Daffodil known to him.

Perhaps before long those farmers who chance to live within reach of large towns may find it not such an unprofitable plant to grow, since the fashion of decorating churches with flowers has been revived in England. When I was young I had never seen a church decorated except at Christmas, when our clerk would always stick a branch of Holly into a hole (made for the purpose) in the top of each carved Poppy-head that ornamented the old oaken seats (built up into pews) in our church. Lenten Lilies, therefore, awoke no association in my mind with Lenten services, and consequently Herrick's lines lost half their meaning to me.

I knew the wild Daffodil in the fields, and as it remains in blossom rather longer than many spring flowers, I could not understand why Herrick should speak of their "hasting away so soon;" but if these lines were suggested to him by cut Daffodils placed in a church, the full meaning of his poem is apparent.

We can fancy the Devonshire parson glancing round at his church decorations after morning service, and regretting that the "fair" Daffodils (an

entirely appropriate epithet to the delicate pale wild flower), would be quite faded before the time of evening service. For be it remembered that the modern contrivances for keeping flowers fresh through a long day's services must have been quite unknown and unattainable to the church decorators of olden times, who lived before the puritanical ideas prevalent in the days of the Commonwealth had banished all ornamentation from our churches.

But though the wild Daffodil, in my opinion, far exceeds the garden variety in beauty, I can quite believe that the latter is more effective for decorative purposes, and that when it was first introduced it may have come into favour so rapidly as to cause the wild flower to fall into neglect; indeed, I never remember to have seen the latter grown in any other garden than our own.

I have just heard of a church that has been decorated this Easter with double Daffodils, set off with Hart's-tongue Fern and Moss, and I am told that their pure bright colour proved very effective. So large a quantity was used that the church was aglow with them; and I can certainly imagine that their golden hue must have given it great brightness and cheerfulness, and been entirely appropriate to the joyful services of an Easter Sunday. Still, it seems to me that the bowed heads of the Lenten Lilies are better suited to Lenten services, and that it is to them that Herrick's lines apply:—

"Fair Daffodils, we weep to see  
You haste away so soon;  
As yet, the early-rising sun  
Has not attained its noon.  
Stay, stay  
Until the hasting day  
Has run  
But to the even-song;  
And having prayed together, we  
Will go with you along."

A. B.

## DR. AINSWORTH'S ORCHIDS.

DR. AINSWORTH'S garden at Lower Broughton, Manchester, has for many years been celebrated for its fine collection of Orchids, and those who have visited the Manchester show during Whit-week have doubtless, like myself, had the pleasure of seeing the groups of these fine specimens which Dr. Ainsworth has exhibited. There are some wonderful specimens in this collection, especially of East Indian kinds, which I wish more particularly to bring before the public, as among them may be found some of the most beautiful of this lovely class of plants. Many of the *Saccolabiums*, *Aerides*, *Vandas*, *Angraecums*, and *Phalenopsis*s, have been growing here from ten to nineteen years, and have chiefly been grown from small plants which I shall endeavour to describe.

The illustration (fig. 87), prepared from a photograph, shows a wonderful example of the plant it represents, *Aerides Schroederi*. It is a perfect specimen as regards health and vigour, and has been grown from a small plant, and exhibited for twelve years at the various shows. I mention this fact for the reason that many people fear that exhibiting their plants injures them as regards cold and travelling, but that is not the case when they are carefully tied and packed for their various journeys. The plant now illustrated, and most of the others I am about to notice, have been about to exhibitions in the same way, some of them being shown at three different times the same year. No doubt some flowers get injured, but where careful attention is bestowed upon them as regards packing, &c., little damage, if any, is done to them. The great secret in taking Orchids into a different temperature is to give them but little water before they are removed, to keep the flowers perfectly dry, and the house not too hot.

The houses here are not built with any pretentious views, but with a view to suit the purposes for which they are employed. The East India and *Cattleya* houses are three-quarter span-roofed, 50 feet in length, 17 feet in width, and 12 feet high in the centre of the ridge, and are divided into two parts, one for the *Cattleyas* and *Laelias* and the other for the East Indian Orchids, which is the largest portion of the house and next the boiler. There is a centre stage, the front part of which is about 3 feet from the roof, so that the foliage of the plants is not more than 1 or 2 feet from the glass, and the plants receive all the light possible. It is a grand stage of specimen

plants, and well worth a journey from London to Manchester to see. The back row consists of *Vandas* and *Aerides*, including an extraordinary plant of *Vanda suavis*, the centre stem of which is 4 feet high, and there are seven others 3 feet high, with fine healthy foliage: when in bloom it presents a grand appearance. Mr. Mitchell has had this plant under his care for about nineteen years; it was bought in as a small specimen, and has been grown to the perfection we now see it in. The next specimen is a well grown *Vanda suavis* *Pescatorei*, with many stems and perfect foliage. *Vanda tricolor* *Ainsworthii* is represented by a specimen 4 feet in height with fine growths. It is a splendid variety. Equally well grown is *Aerides virens* *Dayi*, with five growths and forty leaves on each—a most perfect specimen. The original variety of *A. nobile* is also present in a perfect specimen, 3 feet in height, with seven leads from 2 to 3 feet high. It is a very rare plant, and this is the best specimen of it I have ever seen. Next in order is *Aerides Schroederi*, of which fig. 87 is an illustration. Its main growth is 2 feet 6 inches high, while the three in front are each 2 feet high. It is a most rare and wonderful specimen. The best specimen of *Angraecum sesquipedale* is a magnificent one, being 3 feet in height, in perfect health, and showing four spikes of bloom. Another is 2 feet high, with three spikes of flower. *A. eburneum* is 4 feet in height, with three spikes.

The next row of plants consisted of a specimen of *Saccolabium guttatum* with six growths, and from twelve to twenty leaves on each growth, the main growths being 12 inches high—a splendid specimen. A fine plant of *S. giganteum* measures 2 feet in height, and has five growths; it is a most useful winter-flowering, sweet-scented Orchid. *Aerides Fieldingii* is represented by a very fine specimen having two growths 2 feet high, and thirty-three leaves on each, perfect to the bottom. It is one of the best of the *Aerides* family, producing long spikes of richly-coloured blossoms. Another plant of the same species has three leads, 18 inches in height, and leaves reaching to the pot below. Associated with this is *Aerides Larpentæ*, the main stem of which is 2 feet high, while two others in front are 18 inches high, with leaves touching the pot. Another grand plant is *Aerides maculosum*, with sixteen leading stems, some of which possessed eighteen leaves each—an extraordinary mass. I also noticed a good plant of *Aerides Veitchii*, a rare species, also one of *Aerides Lobbii* *Ainsworthii*, the flowers of which were the richest coloured I have seen. It was exhibited at the Preston Horticultural Exhibition with branching spike 3 feet in length, and secured the admiration of all who had the opportunity of seeing it. Another splendid specimen is *Vanda Denisoni*, the main stem of which is nearly 3 feet high, having forty-two leaves, while two other growths in front measure each a foot in height, and its foliage was perfect to the bottom.

At the end of the same stage was a fine lot of *Phalenopsis* which have been growing in the same place for many years, and are growing well. Among them are some grand specimens, such, for instance, as of *Phalenopsis amabilis*, a plant of which measures 2 feet across the foliage, showing five spikes, some of which were 2 to 3 feet in length; also three other plants of *amabilis*, equally well grown. Many plants of *P. Liddlemaniana* have nine leaves on each, and some of them are 10 inches in length. This variety produces young plants on the flowering stems very freely. Six plants of *P. Schilleriana*, with exquisitely spotted leaves, in a pot 2 feet in diameter, were in perfect health and showing several spikes of bloom. Next to this was *P. grandiflora*, 2 feet across, and showing well for bloom. Many other specimens are equal to these in size and condition. These specimens have been growing in the same place for fifteen years, and many of them have produced young plants on the flower stems, which after having been rooted have been removed and are now almost equal in beauty to the parent plants. On the side tables there are also some examples of good cultivation, noteworthy amongst them being the rare *Dendrobium Ainsworthii* *roseum* ×, a most lovely Orchid raised from seed at this place by Mr. Mitchell; also *Cypripedium Ainsworthii* ×, a cross between *C. Roezlii* and *C. Sedeni*, which has the leaves of *Roezlii* and the flowers of *Sedeni*, only much larger and of a brighter colour. This will prove a very useful and free flowering plant. I also noticed suspended from

the roof some fine plants of various Dendrobies in baskets.

In the next house there are many good specimens of Cattleyas and Laelias, amongst which are some of the best varieties in cultivation. Dr. Ainsworth has for many years been selecting the finest species of this tribe, and has met with great success as the result. *Laelia elegans* is represented by a fine specimen, 3 feet high, it has many bulbs. The variety *L. elegans Schilleriana* has nineteen bulbs, and is also 3 feet high, and when in bloom must make a grand show with its white sepals and petals and richly coloured lip; also *L. Turnerii*, which is very rare, and will be found illustrated in Warner's *Select Orchidaceous Plants*. The plate was taken from the original plant in the collection of the late J. Aspinall Turner, Esq., after whom it was named, and the Broughton plant is, I believe, a part of the original; it is the

ration, I was pleased to see the true *C. labiata* in great beauty.

On the side tables were some large masses of *Pleione maculata*, with their white and crimson blooms. *P. Wallichii* was also thriving well, with its rose-coloured flowers. The *P. lagenaria* was also well in bloom. These are extremely useful subjects for autumn decoration, when flowers are comparatively scarce, and require but little space to grow them in. Here also was a fine *Bollea coelestis*, also the rare *Batemannia Burtii*, which was growing strongly; and hanging from the roof was the rare hybrid *Cattleya Mitchellii* ×, which was obtained from a cross between *C. Eldorado* and *C. Leopoldii*, but it partakes chiefly of *Eldorado* in growth. I am glad to see that Mr. Mitchell has been rewarded for his pains in endeavouring to raise new hybrids, and I hope he will continue to be successful in so interesting

soms. The flowers of this Orchid are most useful for cutting, as they last a long time in water, and make good buttonhole flowers. The curious *M. Chimera* was throwing out its blossoms from the side of the pot. Of *M. Harryana* there were good plants and fine varieties. I also noticed some nice specimens of *Restrepia antennifera*, with its peculiarly spotted flowers and constant blooming habit. Associated with this is the rare and beautiful *Dendrobium infundibulum*, which apparently thrives well in a comparatively cooler temperature than that it has generally been subjected to. Many try it in too much heat, which kills the plant, and so makes it rare. Now that the correct method of treating it has been discovered, I should rejoice to see a large importation arrive in good condition.

*Ada aurantiaca* is also a good cool Orchid; it was thriving well and blooming freely with its rich orange-coloured flowers. Mr. Mitchell is experimenting in a cool house on many plants which we have always thought required so much heat; among others I was surprised to find *Cypripedium caudatum*, which has been grown in this cool house for upwards of three years, and is making a fine plant. It came originally from the East India-house as an invalid, and from that one gains a wrinkle, although I have seen it equally well grown in heat. For those who have only a cool house it will be a pleasure to know that it can be grown in such a structure.

The next house is a three-quarter span-roofed structure, 30 feet in length, 11 feet in width, and 8 feet in height. It has a table on each side, and a path through the centre. I was attracted by a perfect mass of *Ceologyne cristata* which was 3 feet across, and in perfect health. Manchester is celebrated for its specimens of *Ceologyne cristata*, which are so well adapted for cutting and so delicate in appearance.

The *Odontoglossum citrosimum* is an enormous specimen, 3 feet in diameter; I have seen it exhibited at Manchester, and it has been grown here for seventeen years from a small plant. Near this is a large specimen of *Cattleya Mossiae* 3 feet across, also *C. labiata pallida*, which measured 2 feet in diameter, and the rare *Cattleya Ainsworthii*, which is a fine species [?]. There are some good plants of *C. Mendelii*, which produces its showy flowers in May and June. Associated with this is a good specimen of the beautiful *Cattleya Warneri*, of which there are numerous varieties, all of them flowering in May and June, when they are so useful for exhibition purposes. Of *Cypripedium Stonei* there is also a grand specimen, 3 feet across. It is one of the most distinct of the species. *C. villosum* measures fully 3 feet in diameter, with strong growths. This continues in perfection for seven weeks—a quality which makes it so useful for winter decoration.

Amongst all my favourites I must not omit the rare *Trichopilia crispa*, of which there is here a specimen with about a hundred bulbs, which when in bloom makes a grand show with its curiously twisted flowers. Of *Miltonia Regnellii* there is a good specimen, 2 feet in diameter; *Laelia Dayana* was beautifully in bloom, and is a cool-house plant. There were many other plants worthy of notice in this house, but of those that attracted me the most I have already given particulars.

The last house is one which is devoted to Camellias, many of which were in bloom at the time of my visit. I also noticed fine specimens of *Lycaste Skinneri*, some of them having forty bulbs, and which have been grown from small plants imported twelve years since. It is most satisfactory to know and see plants increase as these have done. I also noticed some large masses of *Odontoglossum Rossii majus*, and other fine specimens.

Great credit must be given to Mr. Mitchell for his perseverance and success in growing such fine specimens, especially as he does all without assistance. Dr. Ainsworth is a great lover of Orchids, and derives great pleasure from allowing his gardener to exhibit his favourites. *B. S. Williams.*

THE WALDSTEINIANS.—Although not extremely showy, the species of this genus can fairly claim to be interesting and pretty plants, and desirable occupants of the herbaceous border. All are dwarf herbs with palmately-divided trifoliate leaves and terminal corymbs of yellow flowers. *W. geoides*, from Central Europe, is probably the most generally known; *W. trifolia* is a native of Austria, and *W. sibirica* is, as its name implies, a Siberian plant. The three species just named are now in bloom in the herbaceous ground at Kew.

FIG. 87.—AERIDES SCHROEDERI. (SEE P. 492.)

finest one of its class, with its rich rose and magenta coloured flowers.

Next to this is the rare *Laelia elegans Warneri*, another of the finest Orchids in cultivation. It flowers in summer, and has sepals and petals of a light rose colour, while the lip is of the richest crimson. This, too, is figured in the third series of Mr. Warner's illustrated work. Of *Laelia gigantea* there is also a good plant; it is rare, and of a distinct type, the flowers being 6 inches in diameter, the sepals and petals of a pale lilac colour, delicately spotted with rose-purple, and the lip dark rosy-purple. Of *L. purpurata* there are some good specimens, also of *Cattleya exoniensis*, which was thriving well, and is one of the most useful and ornamental Orchids in cultivation, being a free flowerer and comparatively easy of cultivation. Many plants of *C. Trianae* were in full luxuriance, making strong sheaths. Mr. Mitchell informed me that amongst them were some very fine varieties, all of which are most useful for winter deco-

an occupation. There is a good deal to be done in crossing, but it requires time to see them bloom.

The next house is a low structure for *Odontoglossums*, facing the East India-house, and about 20 feet in length, 9 in width, and 7 in height, with a 4-inch pipe running round the house. It is a very cheaply-built structure, but for all that it contains many fine plants, including some excellent examples of *O. Pescatorei*, showing well for bloom. One of the plants was in flower; it had two spikes, and forty flowers on each. Of *O. Alexandrae* there are some well-grown specimens; also of *O. Hallii*, which had spikes 3 and 4 feet long in bloom. Next this was a good specimen of *O. naevium majus*, also of *O. triumphans* and *O. Andersonianum*, which is a rare species.

*Masdevallias* thrive well at the end of this house, where they seem quite at home. I noticed fine plants of *M. Veitchii* which had good flowers, and of a splendid colour. *M. tovarense* was in full beauty, with its white, sweet-scented blos-

## Forestry.

ONE of the most difficult and perplexing subjects connected with forestry is that of adapting the various species of trees to the soils in which they are to grow. It is one of the most common questions we put, both to ourselves and others, what species of trees should be planted in the soil. Soils of a general average and quality are adapted to a greater variety of trees than exceptional soils are, and when we come to extremes we are then more than ever perplexed what trees to plant. The first thing to do in connection with all planting is to determine the prospective results; for unless we have a definite and specific object before us, we cannot expect to attain it. That much, and by far too much, of the planting hitherto done, and perhaps even still perpetuated, is of a random and hap-hazard kind, is to be deeply regretted; and in forming any plantation, small or great, a clear and well-defined object ought to be before the mind.

Planting ground in its natural and uncultivated state, where nothing artificial has been done to it, is comparatively simple and easy; but to deal with a subject such as poor thin land—too poor for profitable cultivation, and such as, having proved unprofitable under the plough, had to be given up and devoted to trees—such subjects as these are very difficult to deal with successfully, and strain the best skill and contrivance to know how to deal with them.

The growing and maturing of a crop of forest trees necessarily requires such a length of time to complete it, that when any germ of disease exists in its structure it has time for full development before the tree is cut as mature and perfect. A crop of trees, therefore, that requires to stand fifty years in order to attain perfection and ripeness requires to have all the influences that conduce to health properly adjusted, and on their side; but the crop that has to stand to 150 years without anything going wrong requires still further adjustment, and all the influences that contribute to health and longevity still better regulated and accurately applied.

Planting light poor moorland, let out of rotation of cropping because of its unprofitableness for that purpose, is just the one subject of all others most difficult to deal with, and which has probably produced greater disappointment to the proprietor than any other. Such land is very commonly planted with Larch and Scotch Fir, and a mixture of Norway Spruce. Now it is very discouraging to state that any and all of these species of Conifers are quite unsuitable for planting the description of ground under consideration. On the Marquis of Lothian's estate in Roxburghshire such descriptions of ground were somewhat extensively thus planted about fifty years ago, and invariably proved to be great failures. At about twenty to twenty-five years old the Scotch Pine died in great numbers, and without the trees individually giving any premonition of the result. One year the Scotch Fir tree looked healthy and growing, and next year it was dead and withered. The Larches, unlike the Scotch Pines, gave indications of decay usually two or three years before death ensued, and thereby allowed time and opportunity for cutting and turning them to profitable account. The Norway Spruce, though equally vitally diseased, did not manifest the symptoms by any visible outward signs. Its disease consisted in decay of the central part of the stem, emanating from decay of the tap-root, which first decayed and from whence decay extended into the stem. Without further describing the diseases, or causes leading to them, I shall point out what I have seen and experienced as the best and most profitable mode of planting poor, profitless, and exhausted lands that had been manured as well as tilled.

Assuming that the land is dry (and if it is not it is of no avail planting it till it is rendered so by drainage), I would plant all the best soil and most sheltered parts with Larch about 6 feet apart, and the poor and bare and exposed parts with Silver Fir, also 6 feet apart.\* I would also, if the landscape is a consideration, plant groups of Beech here and there, and also some single trees throughout, the latter to remain to clothe the landscape after the Larch and Silver Firs are cut down.

If the soil, however, is not dry and light, but clayey, I would plant Silver Fir and Oak, the former to be

cut and cleared at say seventy years' growth, and the latter to stand to say twice that age. By this means it will be observed that the ground is never rendered entirely bare and treeless, and by planting one species, as the Silver Fir or Larch, the trees can be grown so as to produce clean and valuable timber. The Silver Fir is an excellent tree if well grown, but is too much inclined to branches when growing alone or amongst hard-woods as a mixture. Clay soil also produces the very best quality of both Silver Fir and Oak. C. Y. *Michie, Cullen House, Cullen, Banffshire, April 12.*

## Garden Operations.

### FLOWER GARDEN, ETC.

**DRESSING LAWNS, &c.**—These directions being founded on the writer's own practice, a certain amount of repetition—as the various works in connection with the flower garden, &c., are presented—is necessarily unavoidable. This must be my excuse for again referring to the importance of at once getting lawns in perfect trim by well rolling, and mowing with machine, before the "bents" get hard, which would necessitate scythe-mowing; and if, as in our case, some parts of the turf has a yellow, sickly tinge, it is for want of support, and a dressing of soot, wood-ashes, or guano, applied immediately before rain, would soon change the hue, and so stimulate the growth of the grasses, that Daisies, Plantains, &c., would have but little chance. If worms are troublesome, the best antidote is lime-water. There need never be any fear of getting this too strong; we usually put a wheelbarrow load of fresh lime in a large tank of water, and as soon as clear it is ready for use. Showery weather is the best time to apply it, as the ground being soft, less water is required to bring the worms to the surface, when they may either be picked up at once or left to die, and be swept up next day; after which well roll, and the improvement of the turf will be visible in a very few days. Lawns that have been formed by the sowing of grass seeds will need to be guarded against the depredations of sparrows and chaffinches, and the ground should be kept well consolidated by rolling it at least once each week.

**ROSES AND CLIMBERS.**—Complete the pruning of Roses; stake standards and others that are likely to be affected by wind waving. If the Roses do not entirely fill the beds, the larger spaces may be planted with *Gladiolus* and *Lilium auratum*; and the smaller, and those nearest the verge, with *Violas*, *Pansies*, and *Stocks*, or be sown with *Mignonette*. *Gladioli* and *Liliums* are most valuable in such a position, as they flower after the Roses are over, and so keep up the display; whilst *Pansies*, *Violas*, *Stocks*, and *Mignonette*, flower more or less continuously the entire summer and autumn. At this season *Clematis* and other climbing plants grow so freely that if not attended to methodically—say once a week—they soon get matted together. At first starting, the leading shoots of *Ivy* may require tacking to the wall, but they will cling naturally afterwards. Watering and mulching may be necessary for those that have been recently planted, particularly any that are under eaves of houses or verandahs, where rain cannot reach them.

**SPRING FLOWERS.**—These are now very brilliant, and to preserve them as long as possible in perfect condition mulch with cocoa-fibre, to prevent the surface soil cracking, which occurrence soon dries up the soil, and bulbs excepted, all other spring flowers quickly resent anything like dryness. Plots of *Lily of the Valley* should now have the inert surface-soil, moss, and weeds removed, by carefully working out the same with a handfork, after which give a dressing of new soil, intermixed with rotten manure or guano. New plantations may also now be formed, as also of *Violets* where early runners can be had; of the Russian section by far the best is *Victoria Regina*, it being both larger and more highly perfumed than the *Czar*. Besides planting these in regular order in beds and borders, patches of three or five plants each should be put in the most shady spots amongst hardy Ferns; here they are quite at home, and virtually take up no space, yet frequently produce flowers when the better cared for plantations are flowerless.

**HARDY BEDDING AND EDGING PLANTS** of several kinds may now be planted as opportunity offers. The following are a few of the best for edgings that are formed on the slope:—*Cerastium arvense*, *Hemiaria glabra*, *Sedum glaucum*, *Veronica repens*, *Saxifraga rosularis*, and *Sempervivum montanum*; all these withstand drought well—a quality most desirable in plants that are to occupy such positions. Of hardy plants that are well suited for the formation of designs, or, say, the framework of designs, the list is somewhat meagre, but the following are among the best:—*Sedum glaucum*, *S. lydium*, *Cerastium tomentosum*, *Sedum acre elegans*, *Antennaria tomentosa*, *Mentha Pulegium gibraltarium*, and *Ajuga reptans purpurea*.

As soon as the framework of designs is complete, the central or dot plants should be put in, of which there are now many thoroughly hardy kinds that are in every way suited for summer bedding, or, rather, that harmonise well with summer bedding plants, such as *Vucca recurva*, *Y. filamentosa*, *Retinospora pisifera aurea*, *Cupressus erecta viridis*, *Juniperus Birkii*, *Thuja aurea*, &c., a moderate proportion of which, if dispersed at regular intervals about the parterre, tones down the high colouring that is inevitable when the bulk of the plants used consists of *Pelargoniums*, *Calceolarias*, and *Lobelias*.

**SUBTROPICAL PLANTS, &c.**—Seedlings of these must have every attention as regards potting and warmth, for if once they get stunted the growth fails to start again kindly; moreover, the aim should be to have but a few large sturdily grown plants rather than a great number of inferior ones, as will be the case if left in the seed-pan till the roots get matted together, or if grown under the shade of Vines, &c. *Solanums*, *Ricinus*, *Wigandias*, *Acacias*, *Eucalyptus*, *Acanthus*, *Cannabis*, *Tobaccos*, and *Cannas*, all should be grown in full daylight, as they should all be sturdy plants in 5-inch pots by the middle of May. To make room for these the hardier *Pelargoniums*, *Petunias*, and *Ageratum* will now do in cold pits, whilst *Calceolarias*, *Lobelias*, and *Verbenas* may be planted out in turf pits, and be protected with straw hurdles, &c., on frosty nights. Variegated *Mesembryanthemum* is invaluable for either succulent or foliage arrangements; the quickest mode of propagating this we have yet hit upon, is to put the cuttings in pans, or boxes of fine soil, half sandy loam and the other half leaf-soil; this is made very firm, and the cuttings inserted a couple of inches apart. A good watering is at once given, the boxes placed on bricks over the pipes in vineries or other houses; in a fortnight all are struck, and are transferred to colder quarters, the plants remaining in the cutting-boxes till planting-out time. *Alternantheras* may be struck in the same way, but require more water. These are the least trouble when struck and grown in dung frames; but whichever plan is adopted, their propagation should now be commenced in earnest. W. *Wildsmith, Heckfield.*

### HARDY FRUIT GARDEN.

The favourable change which the weather has taken during the past fortnight has had a wonderful effect upon vegetation generally, and I think fruit trees, as a rule, are fully a fortnight earlier than last year. The beautiful days we had in the latter part of last month, although changing frequently to very low temperatures, with keen winds from the north and east, and white frosts of so threatening a character, have happily been succeeded by weather which for some time past could hardly afford better conditions for the setting of fruit. Gentle showers and moderate sunshine, enough to dry the pollen and render the organs active—such a consummation as has not been conferred upon us so opportunely for a good few years. Still we must be vigilant; the wind has veered round to the east, and our efforts towards protecting the few blossoms that are now visible upon some kinds of fruit trees must not be relaxed. Cherries upon south walls are setting beautifully, and what few blossoms there were upon *Apricots* in the same aspect are already out of danger unless a very unfavourable change for the worse should set in. Standard Cherries are smothered with blossoms in an orchard where the soil is not over 18 inches deep—another proof, if wanting, that extreme conditions sometimes return under certain circumstances a golden harvest when trees cultivated under a more elaborate system are a signal failure.

All kinds of hardy fruit trees are now sufficiently advanced to enable one to judge of the prospects of a crop if nothing occurs to interfere with present appearances. Plums, under all systems of training and in all aspects, are better supplied with blossoms than any other kind of fruit trees, Cherries excepted. Pear and Apple blossom is very scanty indeed, a few trees of the *Pippin* section only promising anything well. It is noticeable that espalier and standard trained Pear trees are with few exceptions but scantily furnished with blossoms, while those upon walls are certainly several degrees better even in the worst situations. The position with regard to hardy fruit may be pretty accurately estimated now, always of course allowing for contingencies in the shape of unfavourable weather returning, which would upset all calculation. Every preparation, however humble it may be in construction, should be at hand, in case it is required to shield the later varieties of fruit trees as they come into flower. The chief danger we have to guard against is extremes of temperature, while a thick covering left on for too long a time will have a debilitating influence upon the blossoms, as well as upon the young growths, and give them a sickly appearance. When there is a movable covering, this is as easily remedied as it is to run a roller-blind up and down upon a hot-house; but permanent coverings, such as branches, are not so manageable; still, the covering may be increased or reduced according to circumstances with-

\* This distance apart is commendable only when the area is great, and there are no gains to damage the trees; but when the plan, at once small and injuries apprehended, 4 feet will be a better distance.

out interfering with the base of the structure for adjustment, with great advantage to the health of the young growths, which are so liable to the attacks of insects after sudden exposure. The past fortnight has been most favourable for grafting operations, which are always most successfully carried out during the moist weather in the early part of the present month. With respect to small fruits, I notice amongst Raspberries that several of the grosser canes are killed to the ground, but the main stock are breaking regularly and well. Gooseberry and Currant trees are amply laden with crops that will be of some value this season. Strawberries are looking the picture of health and fertility; they comprise forced plants of last year and young plants grown from runners in 4-inch pots and planted out early in August last. These are throwing up from three to four vigorous spikes from each crown. With the inevitable dearth of hardy fruit which will have to be met this autumn, a special effort should be made to have but a short "break" in the supply of Strawberries from out-of-doors until the middle of next October. This is accomplished by hardening off a few batches of forced plants and planting them out at frequent intervals for the next six weeks in warm situations where they will have the full benefit of sun and air. Two never-failing kinds for this purpose are Vicomtesse Héricart de Thury and Underhill's Sir Harry; both have excellent constitutions, and will succeed almost anywhere until the flowers are cut off by autumn frosts. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

VINES.—Look over the Grapes in early houses, and if any of the bunches are likely to bind the removal of a few of the least promising berries with a pair of finely pointed scissors will give immediate relief, and greatly improve the quality of the fruit when ripe. The inside borders should be examined and supplied with sufficient water to keep the soil in a moist healthy state until after the Grapes are cut. A fine bright morning is the best time for watering, as all superfluous moisture will then disappear before the air is reduced for the day; and to prevent its escape from the soil a little fresh mulching or short stable-manure may be spread over the surface. The ammonia from this, combined with the stimulating influence of the liquid to the roots, will keep spider in check, but in the event of its spreading careful sponging with a weak solution of Gishurst, although a tedious operation, is a very good remedy for its removal, particularly where delicate skinned kinds, like Frontignans, which are often injured by the fumes from sulphur, are grown with Hamburgs. Give air night and day when the berries begin to colour, and increase it as they approach ripeness, when the temperature may be gradually reduced, but fire-heat must not be entirely discontinued, as what are termed "new" ripe Grapes improve after they are considered fit to cut, and it often happens that the last bunch is much better than the first. Houses in which Muscats and other shy-setting kinds are now in bloom will require a high temperature by day, with a good circulation of air and a fair supply of atmospheric moisture to prevent the young foliage from suffering under bright sunshine. Fertilise with Hamburg pollen if it can be obtained, and reduce the strain on the Vines by giving them rest at night. In efficiently heated vineries a night temperature of 70° is easily maintained, but assuming that the roots are active a few degrees less, with a little air, will be found more satisfactory than hard firing to maintain a given point through all weathers. Take advantage of solar heat for pushing on late houses, as Lady Downe's and other winter kinds cannot be over-ripened if they are to be kept fresh for some months after they are removed from the Vines. Give air early on fine mornings; allow the temperature to rise to 80° with plenty of moisture, and close in time for it to rise up to 90° from solar heat on bright afternoons. A night temperature of 60° will be sufficient until the Grapes come into flower, when a range of 5° more will increase the length of the bunches, and produce conditions favourable to the setting of the fruit. Late Grapes, particularly such kinds as Black Morocco, one of our finest and perhaps worst-managed winter Grapes, do best when planted inside the house with the run of external borders, which should be elevated, well mulched, and exposed to all the rain that falls from the time the Grapes are cut in January until the succeeding crop is ripe in September. It should be understood that nearly all the occupants of these late houses require artificial impregnation. A camel-hair brush is best, as it completely removes a glutinous substance from the stigma in Black Morocco, the which, if left undisturbed, will prevent every berry from setting, while its removal with the brush will render this variety as fine as a Hamburg. *W. Coleman, Eastnor.*

#### MELONS.

In the early house or hot-water pit, as the case may be, these will be approaching maturity, and will therefore require syringing less frequently, and in

damping the plants and house in general avoid damping the fruits as much as possible, as that would cause them to crack. A somewhat dry, high, and airy atmosphere will be congenial to their present condition. It would appear needless to say that the cleaner and healthier the plants are at the ripening period the greater the probability of a highly-flavoured and finely-finished fruit resulting therefrom. We have allowed a second crop to set in this our early house without in any way interfering with the size of the fruit now ripening. We now treat the plants as previously advised, so far as picking off all male and female blossoms, with the usual stopping, &c., until the same second crop has nearly completed the swelling off of its fruit, when we again try for another good set, and so on in the case of each successional crop, without in the least deteriorating the preceding one. After each batch of ripe fruit has been cut we stir the surface of the bed, and tread and add more soil if necessary, after which the whole receives a thorough soaking of clear water, preparatory to the application of the thicker fluid from the manure-tank in the dung-pound, which immediately follows, and which, where the bottom-heat is supplied by dung and leaves, will be sufficient moisture to the roots for the ripening of that crop, the syringe being again applied freely on all favourable occasions. Where the winter-bearing Cucumbers can be dispensed with, the house should undergo a thorough cleansing, the brickwork washed with hot lime, the glass with clean water, and the woodwork with soft-soap and warm water, and the whole made clean and sweet for the reception of Melons. The soil should consist of good turfy loam, if obtainable, with an admixture of old lime-rubble and road scrapings; and should the loam be of a stiff and adhesive nature sufficient charcoal should be added to render the whole somewhat porous; this should be got into the house a few days previous to planting, so that it may become warm. The soil should, as a matter of course, be pressed firmly around each plant when being planted. Successional houses, pits and frames, will, independent of ventilating, require daily attention in stopping, tying, and thinning of the shoots and impregnating the blossoms in the middle of the day when the pollen is dry. All expanded female flowers should be done at the same time, in order to secure a regular set, so that the fruit left, which should be regularly distributed over the principal shoots of each individual plant, may swell together, and thus produce a batch of fruit of uniform size. Get some plants ready for planting in pits and frames in which Potatos have been grown as they become vacant. *H. W. Ward, Longford Castle.*

#### CUCUMBERS.

These will now be plentiful in most gardens in which they grow, that being so our chief object will be to maintain a good supply of fruit throughout the season. This can be easily done by attending to the usual stopping, thinning, and judicious cropping of the plants during the season, with an occasional top-dressing of light loam, to which a third of short well-decomposed dung has been added, and copious supplies of manure-water given to the roots when necessary, which in some cases will be daily, and in others weekly, or less frequently, according to special circumstances existing in each individual case—such, for instance, as plants growing in pots, boxes, and narrow borders with plenty of drainage, and having the bottom-heat supplied by hot-water pipes, to which, with the plants in the full vigour of health and growth, there is little fear of too much water being given; whilst with plants growing upon a bed of fermenting material, and having more scope for root-action, the case is quite the reverse, and in such a case the plants require comparatively little water at the roots. The syringe must be brought into use twice a day during bright sunny weather, and air given freely on all favourable opportunities, avoiding cutting winds, which will cause the plants to make a short-jointed and consolidated growth. The plants must, as a matter of course, be kept free from the attacks of red-spider and green and black fly, which by the free use of the syringe ought to be kept off the plants. Shift ridge Cucumbers into pots a size or two larger than those in which they are growing, to prevent their becoming pot-bound, before being finally planted on the ridge. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

FERNS.—The rapidity with which these are now sending up their young fronds renders an increase of moisture necessary, especially as regards all such as have not been shifted or are in any way pot-bound or cramped at the roots through having only a limited space to grow in. With free and efficient drainage it is almost impossible to over-water plants of this class that are so circumstanced, but with others having fresh soil more judgment and discrimination must be used in attending to them till they get well hold of the new material and become further advanced, when they too will take water *ad libitum*—the point with most Ferns, to keep them in health, being never to allow them to flag or suffer through dryness from the

time they start till they rest again in the autumn. This applies with even more force to the tree kinds, many of which often become crippled and ruined through an insufficient supply. It is essential that their stems be thoroughly wetted at least once a day, which may be readily and quickly done by pouring the water directly on them at the top, or, in the case of any that are tall, by means of a garden engine or syringe, giving them at the same time a thorough sprinkling overhead, which treatment these and other Ferns specially delight in. The Gymnogrammas, however, although liking it, get disfigured by having the farinose grains, with which they are so beautifully ornamented, washed off, and deposited on the upper sides of the fronds; the wetting of these at all heavily should therefore be avoided, and it need hardly be remarked that what syringing is done ought to be carried out before the sun gets on in the morning, or when it is declining in the afternoon on closing the house. As a rule, Ferns are too much shaded, whereby they become weak and drawn, but it is often more the absence of light that causes this unsatisfactory condition from having the blinds long down, or using too thick a material, the thinnest canvas being all that is really wanted, and this only when the solar rays are full on the glass. Here, from having a lofty house, difficult to get at, we are compelled to moderate the sun's influence by the use of fresh-slaked lime, made quite like whitewash, which we run through a very fine sieve to take out any lumps, and then with a brush a man smears it on the outside of the roof, and another follows him immediately dabbing it with another brush or hair-broom so as to leave it like frosted glass, and in this way it lasts on the whole of the summer, getting gradually thinner as the days shorten and rain increases.

GREENHOUSES.—To prolong the beauty of flowers in these shade is essential, but flowers like Ferns may be spoiled by too much of it, as without a proper amount of light the petals lack substance and colour, and the blooms, should they be desired for cutting are not lasting. As regards the plants required for the winter embellishment of these structures, attention must now be directed to such things as the Solanums, which should be pruned back, started into growth, and planted out somewhere, without disturbing the old ball much, in a sunny situation, where, kept watered and duly stopped as the shoots require that attention, they set their berries far freer and better than they do in pots, where, cramped as the roots necessarily are, the foliage seldom keeps healthy, but becomes infested with red spider, a pest to which Solanums of the Capsicastrum class are particularly subject. Of even more importance than these for winter decoration are the Cyclamens, seedlings of which should be pushed on in heat to expedite their growth, and get them as large and strong as possible at this part of the year, that they may have a little rest later on, when they will flower with vigour. The system of drying off old plants in the way at one time practised is a mistake, as it tends to weaken their capacity for blooming, which they only do freely by treating them well now, so as to induce fully developed crowns, for which purpose the old leaves are necessary as long as they can be preserved, the blossoms that are to come being formed at the base of their foot-stalks. It will, therefore, be seen how important the foliage is, and to encourage it the plants should be stood away in a frame where they can be syringed and shut up early for a time, or planted out in a half shady sheltered spot in a bed of refuse peat or loam and leaf-mould to make their summer growth.

For making a display at this latter season nothing is more serviceable than the different varieties of Zonal Pelargoniums, which, thanks to hybridists, now comprise some very fine things, both single and double, the last-named being particularly attractive in the form and rich colouring of their stout petals; and the double, though less showy, are perhaps even more desirable, as they come in so useful for cutting. To get either to flower freely they must have full exposure to all the light and sun they can have, together with plenty of air and a moderately dry atmosphere, which conditions induce a short-jointed stocky habit, with firm shoots and stout massive foliage right down to the pots. The soil best adapted to their culture is a rather adhesive fibry loam, in which they should be potted firmly, and watered sparingly till they become well rooted, when liquid manure will be found a great help in producing a fine head of bloom. The same assistance is likewise desirable just now for the show and fancy kinds, which on no account should be allowed to become dry, or the under-leaves suffer immediately and turn yellow, which greatly disfigures the plants. These will require close watching for green-fly; and to ward them off, and keep the foliage clear till the flowering is over, it is a good plan to subject the whole stock to a fumigating just before the buds expand, when, if placed in a house free from the insects, their beauty will not be marred, as often happens without such precautionary measures being taken. *J. Sheppard, Woolverstone Park.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	April 19	Sale of Established and Imported Orchids, &c., at the Auction Mart, by Protheroe & Morris.
TUESDAY,	April 20	
		National Articular Society's (Southern Section) Show, at South Kensington
		Royal Botanic Society's Spring Show, at Regent's Park
WEDNESDAY,	April 21	Sale of Specimen Orchids, Hard-wooded Plants, Bulbs, &c., at Stevens' Rooms
THURSDAY,	April 22	Sale of an Importation of various Orchids, at Stevens' Rooms

THOSE who like to look on the bright side of things tried to console themselves during the desolating weather of 1879 and the beginning of the present year by the reflection that weather so unpropitious to plants must needs be so also to the enemies of plants. It was supposed by some that slugs and insects and other pests of the garden would be destroyed by the winter's cold. This was to credit the creatures with less intelligence—well, instinct—than they really possess. This fact is well brought out in the useful NOTES OF OBSERVATIONS ON INJURIOUS INSECTS FOR 1879,\* compiled by Miss E. ORMEROD.

"The unusual cold of the winter," says this lady in her report, "and the depth to which the frost penetrated the ground, do not appear to have acted prejudicially on larvae subjected to them either at the time or in subsequent development; and the only cases in which the weather appears notably to have had effect in ridding us of insect attack, is where the persistent rainfall or the tremendous downpour of summer storms have fairly swept the insects from the plants." . . . "An idea being prevalent that 'cold kills the grubs,' I took the opportunity while the great cold lasted of examining the state of all larvae and pupæ I could find fully exposed to its influence, whether unsheltered, under bark, or in frozen ground, and found that in all cases, even where the earth was frozen so hard that the mass had to be broken up with a hammer, and the larvae or pupæ were perfectly rigid, that on thawing they did not appear to be in any way injured."

On the contrary, in some cases the winter was beneficial to insects by bringing about the destruction of their natural enemies, the birds—thrushes and starlings having experienced an almost unprecedented mortality. In the spring of 1879 the cold and wet spring retarded the nesting season, and further diminished the ordinary amount by the great number of eggs that were added.

"The general returns do not show that any kind of injurious insect has been lessened in amount of appearance by the winter cold, excepting (possibly) the Turnip-fly. This has been little prevalent, but (conjecturally) this is rather owing to failure of the Turnip crops than direct weather influence, as noted in the return: 'No Turnips, therefore no fly.'

"Amongst the Lepidoptera some of the injurious kinds have been excessively plentiful in various localities, as also the surface caterpillars. Amongst Coleoptera the weevils of various species have not failed us, neither have the injurious diptera. The crane-fly larvae have fairly ravaged various localities, and the Carrot-fly and Celery-fly have played their part, whilst the Onion-fly has been particularly hurtful in the Isle of Mull. Great injury in many places from the Gooseberry-sawfly, and locally from other species, as also the appearance of *Cynips Kollari*, 'like a scourge,' at the Glen, Tipperary, and (though wasps and honey-bees appear to have been respectively less present or less productive than usual) the great abundance of some species of humble bees in the spring show that the Hymenoptera survived; and on the whole it certainly cannot be said that the cold of last winter has diminished the amount of insect presence in the summer."

We are glad to see that Miss ORMEROD has managed to beat up several recruits among the leading foresters and gardeners of Scotland, who have undertaken to furnish the results of

their observations upon the appearance of noxious insects, and the readiest means of coping with them. Some thirty or more insects injurious to field and garden crops, to Cabbage and Turnips, to cereals, to timber trees, fruit trees and Conifers, are picked out for special observation; and those of our readers who have the opportunity will be rendering good service by communicating to Miss ORMEROD such facts as the exact time of appearance, the nature and extent of the injury done by them, the best means of preventing or alleviating the disastrous consequences of their visitations. To the utility of such memoranda the following extract, relating to the common weevil, may bear testimony:—

"In the present year, 1879, Mr. THOMAS, on examination of his Raspberry bushes at night, found the brown weevils gnawing through the succulent stems of the blossom-shoots, some consequently withering, some being cut right off. At the approach of daylight the weevils went down to the ground and hid themselves just below the surface or underneath stones. Hand-picking, strewing the ground with lime, and daubing the feet of the canes with coal-tar, were tried as remedies, but found to be either insufficient or useless. Mr. THOMAS had then a number of wooden trays constructed, the inside of which was smeared all over with tar. The Raspberries are planted in clumps and bent into arches; after dark one man held a tray beneath an arch, another carrying a lantern gave the bush a smart tap, and the weevils fell into the tray; the tar held them prisoners for a time, and after the tray had been placed under a bush or two the weevils collected were killed by pouring boiling water over them. It was found necessary that the water should be quite boiling to effect this thoroughly. Mr. THOMAS had thirty or forty persons at this work on his grounds, and each bush was treated three times in this way. An immense number of weevils were caught, estimated at hundreds of thousands; and it was hoped by continuing this plan to avoid much future loss. Raspberry grounds at Plening, Polgoon, and Ponjou were mentioned as similarly attacked; and in 1878 Raspberry plots in the large fruit gardens in Gulval and in part of Madron (also in Cornwall) were almost totally destroyed, at a loss of many hundred pounds. Mr. D'URBAN mentions the presence of a considerable number of the *Otiorynchus picipes* on his Raspberries at Exeter; but by the use of a sweeping-net after dark, during the month of June, he prevented any but slight injury from the attack."

Before quitting this subject we may allude to a suggestion that has been made, that a handy-book should be prepared setting forth the remedies that have been found efficacious in checking the destructiveness of insects. In the columns of the gardening journals there is an immense fund of information, but it is necessarily buried in back volumes. Miss ORMEROD would be doing a real service by collecting this information, and we learn that she is willing to undertake the task, provided she have the help of gardeners and cultivators generally. It is proposed that technical terms and hard unfamiliar words be as far as possible ignored, and their place supplied by equivalent English words, wherever conciseness and accuracy are not impaired, as they often are, by the change. The main points upon which information is wanted are the following:—

1. General description of insect attack upon any special crop or plant (that is, what part is attacked, at what season of the year, whether by grub, beetle, &c.), and the means used for prevention or cure. These are the chief points, but others would help, as—
2. Methods by which insect presence is introduced or increased (as being found after any particular crop, breaking up of grass-land, &c.)
3. Spread of insects from weeds which may be food-plants for the grubs, from infested timber or neglect generally.
4. The amount of insect presence or absence on particular soils, or in connection with the state of the soil from drainage, from the application of natural or artificial manures, or the use of mechanical applications, as rolling, &c.

Notes of weather influences, especially of wet and cold in summer, which often hinder development, are important; as also any notes showing the amount of pecuniary loss from insect damage, which would be eminently useful as a means of attracting notice generally to the importance of the subject.

We trust Miss ORMEROD may receive such a measure of assistance as will enable her to produce so useful a book. Those who are willing to assist in the good work should communicate with Miss E. ORMEROD, Spring Grove, Isleworth.

— THE SEASON AND VEGETATION.—Evidently awed by the great political contest that has been going on between the respective political parties in this country, Nature has for the past few weeks almost stood still, and taken a rest. It is very curious to observe how early in the year for a short time there were evidences of an early season. A few warm days and all Nature is agog, pushing here and bursting into bloom there, and spring seems to have come in earnest; ere, however, any great change has been effected the wind veers round to the east, and then comes a check. There may be no frost, there is certainly little sunshine, what rain comes is cold and the skies are dull. A month passes and Nature remains as stagnant as the weather is, so that the spring is no nearer now than it was a month since. We do not take kindly to this chilling weather and low temperature, this lack of sunshine and occasional rains. These latter are far from being the April showers, soft, warm, and gentle, with which the childhood rhyme has associated them in our minds, indeed we rather shiver than feel refreshed and glad. Yet the weather may be all for the best, and our hopes of a fruit season may be elevated by what now looks so depressing; we shall not have any great expanding bloom till the end of April unless a very speedy change comes, but when the bloom does come may it be when biting east winds and white frosts have for this season departed. In one important respect the season so far has been most favourable—it has put the soil into the best possible condition for cropping, indeed it was never better for that important purpose; and there has been for the past two months little or no hindrance to the work of sowing and planting in all parts of the kingdom.

— ELECTRO-HORTICULTURE.—Mr. HUGH CAMERON, of Edinburgh, writing to the *Scotsman* on April 12 says:—"The article in to-day's *Scotsman* on Dr. C. W. SIEMENS' recent experiments in the above connection, reminds me of a question put, and an assertion made, by a certain royal preacher about 2800 years ago, to wit—'Is there anything whereof it may be said, "See, this is new? it hath been already of old time, which was before us;" for I find in the *Border Almanac* for 1873 the following quotation, headed 'A Lost Art,' from the *British (Kelso) Chronicle* of January 12, 1787:—"Last Christmas Day, and frequently since, there was presented at table in Nenthorn House, Kelso, a large Asparagus, Peas, Kidney Beans, and Cauliflower, equally as good as in summer, all produced without the help of a hot-house, flue, or anything of the like nature. The gardener there lately produced a grown salad from the seed, in a close room, in the space of twenty-two minutes and a-half, before a numerous company, by the power of electricity." The *Scotsman* seems hardly puerile to a joke.

— A NEW HERBACEOUS BIGNONIACEA.—A recent number of the *Gartenflora* contains a figure of *Incarvillea Olga*, REGEL, a new herbaceous Bignoniaceous plant, a native of Kokand, where it was discovered by FEDTSCHENKO at an altitude of 4000 feet. Dr. REGEL states that it is one of the most ornamental plants of that country. It is apparently a biennial, growing 3 to 5 feet high, and having simply pinnate leaves and terminal panicles of erect, salver-shaped, rosy-purple flowers about an inch long. It has not yet flowered under cultivation, but Mr. MAX LEICHTLIN and some other persons have living plants, and we may expect they will flower during the present season. Dr. REGEL thinks it may prove hardy.

— APHELANDRA ROEZLII FROM SEED.—At a recent meeting of the Horticultural Society of Berlin flowering plants of this handsome *Aphelandra* were exhibited, which had been raised from seed in six to eight months. This species, it is stated, produces seed freely if kept in a dry place. The seed soon loses its vitality, and should be sown in April. Good flowering plants may thus be had by late autumn and winter,

\* Swan, Sonnenschein & Allen, Paternoster Square.

FIG. 88.—ANTHURIUM ANDREANUM: LEAF AND FLOWER REAL SIZE; SPATHE BRILLIANT SHINING SCARLET; SPADIX IVORY-WHITE. (SEE P. 490.)

— NEW MEXICAN PLANTS.—The third part of Mr. W. B. HEMSLEY'S *Diagnoses Plantarum Novarum*, &c., has just appeared. It contains upwards of fifty Leguminosæ, chiefly belonging to the genera *Desmodium*, *Brongniartia*, and *Bauhinia*; and there is also a new *Trifolium*, several *Astragali*, and a new species of the singular genus *Minkleria*, an ally of *Phaseolus*. There are three additional species of *Sedum*, making altogether twenty-one that Mr. HEMSLEY has described from this region. Ten species of *Cuphea* are followed by an *Abelia* (*A. coriacea*), the second found in Mexico, several species of *Galium*, a *Juglans*, a *Bravoa*, two *Agaves*, and *Leptorhiza*, a new genus of *Commelinaceæ*.

— MR. LEEDS' NARCISSI.—The fine collection of hybridised seedling Narcissi, raised by the late Mr. LEEDS, of Manchester, is now blooming in Mr. BARR'S nursery at Tooting, and shows a very interesting gradation of forms, the most remarkable of which are those which range from poetical up to incomparabilis by almost insensible gradations, and yet diverge so as to afford considerable variety. Mr. BARR has commenced the task—by no means an easy one—of selecting the forms and ranging them under different types, named Leedsii, Burbidgei, and others, of each of which the most distinct of the sub-varieties will be propagated for sale. The variations consist in the size, breadth, and colour of the spreading perianth segments, and in the size, form, and colour of the corona, and then again in the combinations of these variations in individual forms. The whole series, as well as the many striking forms of the Ajax group, are available for the spring flower-garden, and some of the many forms of each are indispensable.

— ACER CIRCINATUM.—In the Arboretum at Kew one of the most striking of low trees or shrubs at the present moment is the subject of this note—the Vine Maple of Oregon and Washington Territory. Its umbels of deep red flowers and the large bracts, deeply suffused with red, beyond which the roundish-cordate, seven to nine-lobed serrulated leaves are just beginning to unfold, contrast wonderfully with the soft light green of the young foliage. In the shrubbery, particularly where the species has a background of dark green, it is in the early spring a very effective plant. In its native habitats, according to Dr. GEO. VASEY'S *Catalogue of the Forest Trees of the United States*, it "has a low and frequently reclining or prostrate trunk, which sends forth branches, at first upright, then bending down to the ground, and forming almost impenetrable thickets."

— DAVENHAM EARLY MELON.—This Melon was raised by Mr. JAQUE, who received a First-class Certificate for it from the Fruit Committee of the Royal Horticultural Society the second week in May last year. The flesh is deep green, and it is not only an early Melon possessing fine flavour, but is evidently a very free bearer. On the 2d of the present month (April) we saw two small houses filled with it; the plants had set fruit in far greater numbers than they could mature, which is a property not by any means always possessed by good varieties of Melons, yet nevertheless very desirable. The fruit runs to about 2 lb. or 3 lb. in weight. The crop on the earliest plants, when we saw them, had reached about half their size, and were altogether as promising as any early crop of this fruit we have ever met with; and in these times, when the varieties of Melons are almost innumerable, with so many of the white-fleshed kinds, which even on account of colour many do not like, a really good green-fleshed early sort will be acceptable to most people.

— THE BLUE FIELDS OF HAARLEM.—Writing from Haarlem on the 14th inst. a valued correspondent says:—"The Hyacinths are now in full flower, and make a splendid show, much better indeed than last year's, as this season they have not suffered at all from bad weather by day or frost by night. The winter has done them no harm, and in general the plants look very strong and healthy, so that the prospects for the next harvest are very good; but a fine warm summer is wanted to ripen the bulbs well. Those who intend visiting Haarlem to see the Hyacinths in bloom should go at once. Besides the Hyacinths in the open field they will have an opportunity to see choice collections of Hyacinths planted in show beds under tents—real exhibitions. Two such beds, each containing 350 Hyacinths,

arranged in pairs of the same variety, have been planted at Overveen by some of the leading florists and growers there. They contain a good number of fine blooms, and especially several novelties, or not generally known sorts. At Haarlem, in the well-known nursery grounds of Messrs. KRELAGE & SON, two other such beds have been planted, each containing 600 plants: in the one arranged in lines, six plants of the same sort, viz., 100 sorts, which makes a most splendid display of colours; the other is arranged in single specimens, and contains perhaps 300 varieties. As Messrs. KRELAGE'S collection is one of the most complete, containing every sort known in the Dutch trade, as well as many novelties belonging to the establishment, a very fine selection may be made, and which would prove of high interest to every lover of Hyacinths. Such show beds are an old fashion of showing Hyacinths. About a century and a half ago they were to be found in the garden of every first-rate Hyacinth grower, as well at Haarlem as abroad. In the well-known *Traité des Jacinthes* of the Marquis of Saint Simon they are described and figured as *Courtes de Parade*. In the first part of the present century they were still found in some of the principal gardens in Haarlem. Messrs. KRELAGE were the last who planted them, but stopped doing so in consequence of the great importance which was given to Hyacinth showing at Dutch and Belgian exhibitions. Since 1878 this firm has not shown for competition, and it has now again taken up the old fashion of planting show or parade beds. This year their planting was a success. They intend to continue in this manner, and make their show yet more perfect another year."

— KERRIA JAPONICA VARIEGATA.—In the Winter Garden at Kew there are several plants of this charming shrub in full bloom. Planted out at the outer edges of the beds they are very conspicuous, their prettily blotched foliage and profusion of solitary, terminal, orange-yellow blossoms forming a graceful and effective contrast with the deep green foliage of the shrubs surrounding them. This form is not nearly so strong a grower as the double-flowered green-leaved plant so frequently met with in old-fashioned gardens, but is a dwarf, neat-habited bush with smaller foliage. For cool conservatory decoration—and it is worth a place in any cool-house—there are few more desirable shrubs.

— DR. ENGLER, Professor of Botany at Kiel, is now at Kew studying the Burseraceæ, a monograph of which he is preparing for DE CANDOLLE'S *Suites au Prodromus*, &c.

— CALTHA LEPTOSEPALA.—This pretty aquatic, which is somewhat rare in cultivation, is now flowering in the herbaceous department at Kew. It is not of such luxuriant or robust habit as the common Marsh Marigold of our river-banks and marshes, yet bears a general resemblance to that species. The cordate-crenate leaves are somewhat smaller than those of *C. palustris*; the flower-stems are erect, and for the most part bear but a single blossom, which is white, relieved by a mass of golden-yellow anthers. It was found by MENZIES on the north-west coast of America, and by DRUMMOND in alpine swamps in the Rocky Mountains, between the latitudes 52° and 55°.

— NEW HELLEBORES.—In the fine and extensive series of Hellebores which has been got together by Mr. BARR in his bulb-ground at Tooting—probably the finest collection in existence—are two or three novelties of great merit, which deserve record. They all belong to the group of which *H. orientalis* is the type, and which is the most important in the genus when regarded from the decorative point of view; and we believe they are all from a batch of unbloomed seedlings purchased from M. LEICHTLIN. One, named Peter Rudolph Barr, has the large imbricated bell-shaped flowers of the *orientalis* type well-developed, but the colour is a deep reddish plum-purple, with darker lines on the exterior, and with a thick glaucous bloom; the inner surface being closely marked with small darker purple dots, which are more or less distinctly arranged in lines after the style of the markings of some varieties of *Tydaea*. It is in the way of a variety called *F. C. Heinemann*, but is a much better thing, and is without exception the finest Hellebore of which we have

any knowledge. Another variety of the same batch, named *punctatissimus*, is the freest-blooming variety we have met with, and belongs to the same vigorous-habited, large-flowered, broadly imbricated *orientalis* type as the foregoing, but is much lighter in colour, the ground colour being of a pale pinkish-purple, or lilac-purple, with the usual greenish patches seen on some of the sepals in most of the forms, the whole of the inner surface being, however, thickly dotted with purple. A third, named Arthur Collins, is of a dark reddish-purple outside, the three inner sepals being of a deep blush inside, and marked near the base with a few dark red lines and near the centre with sundry spots of the same colour, while the two outer sepals are greenish on the inner face and not spotted. This also is a distinct and showy form. Another form of the same group, of which specimens have been received from the Hale Farm Nursery, Tottenham, and to which we have given the distinctive appellation, Thomas S. Ware, is a large and showy form, producing large and much-imbricated flowers of good form, the sepals being deeply stained of a rosy-purplish tint, but without any conspicuous spotting. These four varieties, with that named Dr. Moore, noticed last year, are very important advances on the the Hellebores previously known. *T. M.*

— THREAD FROM WOOD.—We quote the following remarkable paragraph from the *Timber Trades Journal*:—"A New Wood Industry: The manufacture of thread for crochet and sewing purposes has recently been started at the Aby Cotton Mill, near the town of Norkoping, in the middle of Sweden. The manufacture has arrived at such a state of perfection that it can produce at a much lower price thread of as fine quality as "Clark's," and has from this circumstance been called thread "à la Clark." It is wound in balls by machinery, either by hand or steam, which, with the labelling, takes one minute twelve seconds, and the balls are packed up in cardboard boxes, generally ten in a box. Plenty of orders from all parts of Sweden have already come in, but as the works are not yet in proper order there has hardly been time to complete them all. The production gives fair promise of success, and it is expected to be very important for home consumption."

— SEED-GROWING IN QUEDLINBURG.—Quedlinburg is second only in importance to Erfurt as the centre of a seed-growing district in Germany. The cultivation of Sugar-Beet in Europe gave a great impulse to the industry, though the raising of vegetable seeds commenced towards the end of the last century. In the *Monatsschrift des Vereines zur Beforderung des Gartenbaues*, &c., Dr. WITTMACK gives some interesting particulars respecting the rise and progress of the industry in this centre. The principal business is still in the seed of Sugar-Beet, the average annual production for Aschersleben and Quedlinburg together is 40,000 to 50,000 cwt., besides from 8000 to 10,000 cwt. of Mangel Wurzel seed. Independently of seed for home consumption, Quedlinburg exports large quantities of Sugar-Beet seed to Russia and Austria. The following figures will give some idea of the immense quantities of vegetable seeds annually produced:—

	Cwt.		Cwt.
Carrots	3000 to 4000	Beans	5000 to 6000
Onions	1000 to 1200	Kohl Rabi	400 to 500
Lettuce	to 800	Cucumbers	150 to 200
Cabbage	200 to 300	Clichery	500 to 600
Peas (garden)	6000 to 8000	Parsley	600 to 800

— THE HORSE CHESTNUT IN GREECE.—In SIRTHOR'S *Flora Græca* it is stated, on the authority of Dr. HAWKINS, that the Horse Chestnut grew on Mounts Pindus and Pelion, but until quite recently it was doubted whether this tree was really wild, or, rather, indigenous in South-eastern Europe. At the Botanical Congress of Florence Professor ORPHANIDES expressed his belief that it was a native of some parts of Greece, but he was unable to give exact localities. According to a letter from Dr. HEIDREICH, the director of the Botanic Garden at Athens, to Dr. BOULE, which appears in the *Monatsschrift des Vereines zur Beforderung des Gartenbaues*, &c., the Horse Chestnut is undoubtedly wild in the mountains of Northern Greece, Thessaly and Epirus. He himself has seen groups of trees in various localities in the mountains of Eurytania. In the course of his travels last summer he discovered the Horse Chestnut in five different localities, all of them in the lower Pine region, at altitudes of 3000 to 4000 feet above the sea. It occurs in shady forest ravines, associated

with Alder, Walnut, Plane, Ash, various Oaks, Holly, Hop Hornbeam, Acer platanoides, and Abies Apollinis.

— SYDNEY INTERNATIONAL EXHIBITION.—We learn from the *Colonies and India* that Messrs. JAMES CARTER & Co., of High Holborn, have been recommended by the jurors for the award of the 1st prize for seeds at the exhibition now being held in Sydney.

— THE STAPLEFORD ROSES.—We have received from Mr. H. BENNETT, of Stapleford, a flower of his beautiful new Rose, Her Majesty, one of the "pedigree" flowers which have made such a sensation amongst rosarians. It is a most beautiful novelty, of full size, perfectly double, and of a soft clear pink colour, the plant being, moreover, as we learn, of a vigorous habit of growth. It will undoubtedly take a place in the first rank amongst light-coloured Roses. The variety will be shortly figured in the *Florist and Pomologist and Suburban Gardener*. With it came a charming little white Rose, "from the same parents," which, though not a show Rose, is likely, we are told, to be a good bedder, and, as we can vouch from personal observation, is a beautiful subject for bouquets, the buds being simply charming—so pure and fresh in colour, so pleasing and perfect in form. The blossoms of this, however, Mr. BENNETT states, come of a pale yellow in the second flowering.

— INTERNATIONAL HORTICULTURAL EXHIBITION.—We understand that the question of holding an International Horticultural Exhibition in Edinburgh in 1882 is being discussed in that city, if it has not already been decided upon.

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of this Society, to be held at 25, Great George Street, Westminster, on the 21st inst., at 7 P.M., the discussion on Mr. W. ELLIS' paper "On the Greenwich Sunshine Records, 1876-So," will be resumed, after which the following papers will be read:—"On the Rate at which Barometric Changes Traverse the British Isles," by G. M. WHIPPLE, B.Sc., F.R.A.S., F.M.S.; and "A New Form of SIX'S Self-registering Thermometer," by J. W. ZAMBRA, F.M.S.

— RHODODENDRON CAUCASICUM LUTEUM.—There is a nice bushy plant, about 9 inches high, of this Rhododendron on the rockwork in the York Nurseries, which is bearing a fine truss of large pale yellow blossoms, which is very pleasing.

— THE WEATHER.—General remarks on the weather during the week ending April 12, issued by the Meteorological Office, London:—The weather during this period was generally cloudy with frequent, though slight, showers. Thunderstorms were experienced over central and eastern England on the 6th and 7th, and both there and in many other parts of the country showers of hail occurred on those dates. The temperature was about equal to the mean in Scotland, but below it in all other places, the deficit being as much as 4° in the "Midland Counties" and "England, E." The highest of the maxima (60° in London and Cambridge) occurred on the 7th, and very slight frosts have been registered in most districts during the week. The rainfall was a little less than the mean in all districts. Bright sunshine was experienced much more constantly over Ireland and "England, S.W." than in other parts of the kingdom. Over nearly the whole of Great Britain the sun could only be seen clearly for about a quarter of the time during which it was above the horizon, and in Ireland the greatest duration recorded for the whole week was only 44 hours. The wind at the commencement of the period was south-westerly over the whole country, but on the 7th it had shifted to north in the west, and to west in the south, and during the remainder of the period northerly, north-easterly or easterly breezes prevailed on all our coasts. In force it was generally moderate or light, but occasionally blew freshly or strongly at some of our western and south-western stations.

— GARDENING APPOINTMENT.—Mr. ANDREW ARMSTRONG, who for many years had control of the extensive garden establishment at Red-Rice, Andover, Hants, shortly takes charge of the gardens at Eagle Cliff, Greenhithe, Kent.

A NEW USE FOR THE STEMS OF ARUNDO DONAX.

WE have before referred to the enormous trade carried on in London in the manufacture of walking-sticks and umbrellas and parasol handles.

Notwithstanding the large number of these useful and ornamental articles that are constantly being produced, and the consequent demand for certain kinds of sticks, there is every now and then a utilisation of something quite new, and different from anything that has hitherto preceded it. Such, for instance, was the discovery and adaptation of the fasciated Fuller's Teazle stems which we noticed some two years since, and which some of our readers will remember were imported in vast numbers from France for the sole purpose of converting into parasol-handles.

As in other things, fashion rules the kind of handles that our umbrellas and parasols should assume; and of late years the greatest demand by far has been for what are termed natural sticks, which, as the term implies, are those produced by natural growth rather than mechanical manipulation—such, for instance, as Cork Oak and the rooting portion of Ash saplings, both of which have been extremely popular amongst connoisseurs in these things.

At the last meeting of the Linnean Society specimens of a newly-introduced cane, supplied by Mr. Henry Howell, the importer, were exhibited both in

FIG. 89.—JAPANESE PARASOL, WITH HANDLE OF ARUNDO DONAX.

the rough and finished states. These canes are those of Arundo Donax, and the peculiarity which has caused them to be taken up for the purpose to which they are now applied lies in the irregular and fantastic forms of the rhizomes, and especially in the ring-like ridges which encircle these rhizomes at regular intervals. Owing to the combined form, surface markings, and natural yellow tint, which harmonises so well with the coverings used, a more unique handle could hardly be produced. This was fully exemplified by the exhibition of a finished parasol lent for the purpose by the wholesale manufacturers, Messrs. Long & Co., of Paddington Street, who, we are told, are using many thousands of these canes entirely for parasols, which are a novelty in themselves, irrespective of the handles, being covered with brocaded silk, and having numerous gilded ribs, resembling the Japanese umbrella (fig. 89). From a sketch of one of these stems, with the rhizome attached, which was submitted to us before we had seen the actual articles, and before we were acquainted with the country from whence they were procured, the plant producing them was supposed to be a species of Bamboo, probably very near Bambusa nana. Upon an acquaintance being made, however, with the actual stems and rhizomes, there was no difficulty in pronouncing them to be those of Arundo Donax. Unfortunately the first impression as to its botanical origin was seized upon, and as it was necessary to give the cane a name at once by which it should be known in commerce, and as Bambusa and Bambusa were already applied, the specific name of Nana was taken; so that, though a misnomer, this cane is now commercially known as the "Nana Cane." A very large number of these Arundo stems, attached to parasols, are now to be seen in the windows of fashionable West-end houses. *John R. Jackson.*

Home Correspondence.

Trug.—Your correspondent "O." is, I think, mistaken in supposing that our Sussex word, "trug," is borrowed from Germany. I may premise that a Sussex man will generally call the article simply a "trug;" trug-basket is, I believe, a modernism. The word has, I have no doubt, been in use in Sussex from the time of Cissa and the first Saxon incomers. It no doubt derives from the Anglo-Saxon equivalent to the German verb, "tragen," to carry; we retain the compound word, betray, to draw aside or out of the way; and the primary word is perhaps represented by the verbs "draw" and "drag." Tray, no doubt, is another derivative. Any one who has an Anglo-Saxon dictionary at hand will probably easily find the word. Many words are still in use in Sussex, cognate with German words, but not derived from the latter, as reeky, murky (G., *rauhig*), giftly, poisonous (G., *giftig*), &c. The Rev. W. H. Parish has published a dictionary of the Sussex dialect, where those who may wish to pursue the subject will find much of interest and amusement. Another cognate word is in much use in Sussex, viz., "truck," not in the sense of a low vehicle, but in a very wide sense, for matter in a portable form. I have heard it applied to garden stuff, timber, cloth, &c. This is good truck, that bad truck, the other but poor truck, and so on. *Sussexensis.*

Masdevallia bella, Backhousiana, and Chimæra.—These curious and beautiful plants are now in flower here, and are worthy the notice of all lovers of plants, on account of their combination of beauty with singularity. The curious triangular flowers, chocolate and cream in colour, blending with a free admixture of villous glands, gives the idea that they have tried to mimic the Stapelias, and the slipper-like lip shows a tendency towards Cypripediums. I find that the only safe plan of cultivating this set is in baskets, as the flower-stems are so modest that they try to keep the flowers out of sight by hiding them in the moss. *J. Croucher, Gr. to J. T. Peacock, Esq., Sudbury House, Hammersmith.*

Gardenias.—I send you a shoot of Gardenia cut from one of ten plants turned out of 3 and 5-inch pots thirteen months back. The plants individually are not nearly so large as they would have been had a more vigorous course of treatment been adopted, but I have no doubt in a little time we shall be able to cut between 2000 and 3000 blooms. We grow them in a small span-roof house in soil composed principally of lumpy peat, and built to form a cone, on good drainage, which admits of an enormous quantity of water being used without the soil becoming at all sodden or sour. Some gardeners experience much difficulty in keeping these plants clean and free from insect pests, but this is an easy matter, as by syringing daily in a vigorous and energetic manner the plants can be kept thoroughly clean and free from bug. *H. L. H.*

Eupatorium riparium.—To florists and, indeed, to floriculturists in general, there can be few more useful spring-flowering plants than this. It is easily grown from cuttings taken annually, and gives little inducement to visits of troublesome pests. The white flowers, of which there is the greatest profusion, are highly suitable for cutting, opening in succession and lasting long. Care must, however, be taken not to allow the roots to get dry, as it is particularly apt to lose its lower leaves. Cuttings, as soon as they can be got, may readily be struck in heat. *John Wilson, St. Andrew's, April 13.*

Old and New Leaves on Maréchal Niel Roses.—In a cool orchard-house here we have several Maréchal Niel Roses which have never shed last year's leaves. The old and new leaves are now entwined amongst each other, and the young wood is bearing flowers profusely. This is an unusual occurrence in my experience, and may no doubt be ascribed to the want of sunshine last year. The flowers are coming green, instead of a deep yellow. *W. Hinks.*

Asparagus Kale.—Will you please say what the true Asparagus Kale really is? The information would oblige many of your readers besides myself, as Couve Tronchuda, Buda Kale, Jerusalem Kale, and other Kales, are often given for it. *W. H., St. Mary Cray.* [We shall perhaps best assist our correspondent by reproducing from our volume for 1873, p. 108, the paragraph on the Asparagus Kale in Dr. Hogg's "Report on the Kales Grown in the Garden at Chiswick in 1871-72":—

*Asparagus Kale.*—The original Asparagus Kale of a century and a-half ago was a sprouting Broccoli, which was introduced from Italy. It received its name from the young shoots, terminated by a "button," bearing somewhat of a resemblance to the young shoots of Asparagus. In course of time the name gradually ceased to be identified with the Broccoli, and was applied to

another variety of Kale, also introduced from Italy, called Milan Kale, or Chou de Milan, which has the property of throwing up in the spring a profusion of long succulent shoots, which, when fully grown, resemble the shoots of Asparagus. But there are several other varieties of Kale to which the name is applied; and as there seems no uniformity on the subject, I shall quote the varieties which different seedsmen regard as Asparagus Kale. Messrs. Munier, Nash & Nash are correct in supplying Milan Kale. Messrs. Fraser and Mr. B. S. Williams supply Budy Kale. Messrs. Beck & Co., Messrs. James Carter & Co., Messrs. Henry Clarke & Sons, and Mr. George Gibbs, supply Couve Tronchuda. Messrs. Wrench & Sons, Messrs. Sutton & Sons, Messrs. J. & C. Lee, Messrs. Nutting & Sons, and Mr. William Paul, supply Siberian Kale. And it is to be remarked that, as all these varieties produce an abundance of succulent shoots in spring, the name is not unapplied; still it would be as well if it were confined to one particular variety, and this should be the Milan Kale.

**Clay's Fertiliser.**—Though "A. D., Bedford," speaks very favourably of this manure, at p. 470, he evidently has not in this instance found it a success as a Potato manure, which we wish to account for—by stating that "A. D." had received instructions to use about 10 cwt. per acre of two other manures, and wishing, as he thought, to try them all fairly, used the same quantity of Clay's Fertiliser. Now we find 4 cwt. to 6 cwt. per acre to be a heavy dressing, and we believe that it was entirely owing to this large quantity being used that a better result was not obtained. This manure being very highly concentrated, if more of it is used than the plant requires, it has a tendency rather to check than to encourage growth—a result which practical men will at once understand. *Clay & Levesley.*

**Cattleya citrina.**—We have now, and for some weeks past have had, a fine lot of *Cattleya citrina* in flower. They are really beautiful things, and the fragrance gives so delicate an odour to the house that I think they exceed all Orchids in that respect. *J. Croucher.*

**Grassy Beds.**—At a time like the present, after two such winters and a cold summer, when many alterations must necessarily be made in bed and border, it may not be inappropriate to suggest to some of your readers who may not have thought of it, the idea of a "grassy bed," or, more properly speaking, a bed of grasses of various kinds and colours intermixed with Lilies and Gladioli, and with various other plants, to vary the light foliage of the former and give effective relief to the glow of the Gladiolus and the pallor of the Lily. Those who can devote a large circle, or, better still, a capacious oval in a corner of their lawns, where it may be seen from their windows, will not regret this arrangement. Half a breath of air on a serene summer day will stir the light, feathery grasses, and give that movement to the group that adds life to its beauty—and this makes it cheerful to look upon. Should any of the grasses disappear, as they sometimes do, a few plants of the variegated *Zea japonica* from the conservatory will fill up the gaps, and do more than restore the race and beauty. About two years ago such a bed was made in the lady's garden, and not one has proved more popular. It always attracts observant visitors, and is interesting from the earliest spring to the latest autumn. The bed was trenched quite a yard deep—two good layers of stable-manure with one of loam between were given, and plenty of silver sand on all the bulbs to be planted, as the rich soil would be generally moist even in summer. Partial shade is afforded by pine trees, but it is open to the south. The highest part of the bed is formed of *Arundo Donax*, *A. conspicua*, *Bambusa Metake*, *Tritoma grandis*, and *T. glaucescens*: the latter is the most hardy and free to flower after severe frost. *T. uvaria* cannot stand such cold as we have lately had. There are plants of *Eryngium amethystinum* and *rigidum*; their indigo stems and oval heads contrast charmingly with the flaming spikes of *Tritomas*, and so do the blue globes of *Echinops Nitro*, for they all come together, with choice Lilies and the fretted spires of the Gladiolus between. *L. longiflorum Takesima*, a spotless oval of dazzling white, recalls Shakespeare's line on "painting the Lily," but here are not only painted Lilies, but some encrusted with gems as *L. speciosum rubrum*, some that look like a fading sky—*L. testaceum*, and others that seem to have caught and imprisoned each sunset since their birth; *L. tigrinum Fortunei major fl.-pl.*, perhaps the most showy and the most trustworthy of the sisterhood. There are bluish plants of *Euphorbia myrsinotes*, very telling too, in their cool half tints; there are tall spikes of *Hyacinthus candicans*, fringed with their nodding waxen bells, which last so long; and little stout, praiseworthy *Kniphofias*, nearer the edge, untouched by time, but carefully guarded from slugs in their perforated collars—for did we not lose the finest bloom, cut off in one night, like "Jonah's Gourd"? The edge of the bed next the turf is planted with *Colchicum byzantinum*; their metallic leaves

show up in early spring, and look very attractive when the first crowding begins. The second or raised edge is formed of dwarf grasses, four in number, planted alternately, and when the Crocus leaves die down and disappear they spread their tinted cushions to the light—blue, silver, green, and gold; they are, respectively, blue Fescue-grass, *Dactylis elegantissima*; green Fescue, and the gold with a very prosy name, *Alopecurus pratensis aureus variegatus*. The first flowers that gladden our eyes on the grassy bed are Lilies—*Perdita's Lilies*, Crown upon Crown, Imperial Fritillary. There is one coming now, that promises ruddy bells, and its broad foliage is margined with gold; then there are others that are simply perfect in their burnished leaves and green metallic shafts. Next, we expect a host of Tulips. Does not Southey call them "the wine cups of the sun"? They peep through here and there among the growing grasses. *Proserpine*, *Conleure Cardinal*, *Prince*, *La Precieuse*. *Thos. Moore*, and an exquisite flower that lost its label, were the favourites last year, and now they are coming again. We have tried the *Primula japonica* in this damp rich bed, and hope they will answer, for they do not like the warm dry soil here in other parts of the garden. The blue Lime-grass, *Elymus glauca*, is most effective, and a new sort of ribbon-grass is more variegated than the old kind, and is coming up in silvery grass not far from the edge. Hoping others will try a bed of grasses, &c., and derive the same pleasure from it, we conclude, though the subject is too fascinating to be soon exhausted. *H. M. E., April 13.*

**The Druids and their Religion.**—As you have included in your last number a portion of a paper which I read before the Victoria Institution, you would further oblige me if you would present your readers with a slight correction. In the completed and now published copy (price 6d.) of *The Druids and their Religion*, for what is called the people's edition, you will find the quotation marks omitted. This is important, because this portion is simply a condensation of a part of an article, occupying forty-one pages, of the *Mémoires de l'Académie des Sciences*, and does not pretend to do justice to the very elaborate treatment of the subject by the author. It also includes some thought from myself and others. The question whether the Mistletoe still exists on the Oak is fully discussed. *M. Magdelaine* has searched for it in France without success, and experiments to procure its artificial growth ended in failure. It seems, however, that it has been of recent occurrence, as in January, 1878, a branch of Oak bearing a magnificent plant of Mistletoe was presented to the Museum at Semur. It has also been reported near Vitteaux, in the Côte d'Or. I should be glad to learn what is known about the matter in England. *John Eliot Howard, Lord's Meate, Tottenham.* [The subject has been pretty well exhausted by Dr. Ball, in the *Journal of Botany* and in our columns. We gave a figure of a Mistletoe Oak, in Eastnor Park, in 1878, vol. x., p. 121. Eds.]

**Mackaya bella.**—The plant which has been flowering so abundantly here was raised from a cutting in May, 1877, and was potted in peat chiefly but made no progress. It was then shaken out and re-potted into loam with a mixture of charcoal and sand, and grown freely in moist stove-heat. Last summer it was fully exposed to what sunshine we had, being kept in a cool house near to the glass when it formed its flower-spikes, and in November it was removed to a warmer temperature. The plant in question from which the flowers sent to you last week were taken is now in a 12-inch pot, and is about 5 feet high and proportionately bushy, and has had fully four dozen sprays of flower upon it which began opening early in March. *William Jinks, Gr. to J. E. Wilson, Esq., Edgbaston, Birmingham.*

**Primula pubescens.**—The *Primula* under this name, alluded to at p. 465 of the *Gardeners' Chronicle*, is probably *P. villosa*, of which what used to be called *P. nivalis* is merely a white variety, the true *P. nivalis* being a totally distinct species. *P. villosa* is plentiful in some parts of the North of Scotland. *A. L.*

**Pedigree Roses.**—A few days since I was very fortunate, through the kindness of Mr. Bennett, in seeing two of his seedling Roses in bloom, and which, for beauty and quality, will, I venture to think, eclipse any of those already sent out by him. Her Majesty is a Rose which requires and deserves the combined efforts of a Hole, a Radcliffe, and a Hibberd to do her merits full justice. For strong, sturdy, spiny growth—for massive and magnificent foliage—for size and splendour of bloom and superlative colour, Her Majesty is unrivalled. I may convey a faint idea of her beauty by stating that she is a very deep coloured, intensely bright, extremely large and double Madame Rothschild—so double and full that an over-aged blossom showed not the least symptom of looseness or openness in the centre, and the outer petals were as stiff and erect as those of an opening bud. Her Majesty is the result of a cross between Rose

Mabel Morrison and Canary (Tea). Countess of Pembroke is a seedling from Adam crossed with Charles Lefebvre. It is of an intense deep rose colour, without any shading, very double and perfect in form, and deeper in petal, perhaps, than any Rose in this section; it possesses a delicious scent. It is strong and vigorous in habit, and its depth of petal and intense colour makes one almost imagine at first sight that the *Maréchal* has donned a rose-coloured coat. Mr. Bennett speaks of these two varieties as the best he has raised. The manufactory of new Roses at Stapleford now presents an appearance which to lovers of Roses is simply enchanting, not for quantity of bloom, nor size of plants, but from the myriads of tiny gems which seem to spring into existence as if by magic, and which are destined shortly to astonish lovers of flowers by their beauties. The vigour and perfect health of all, whether in embryo or in an enlarged state, is remarkable, and plainly prove that Mr. Bennett and Mr. Woods, his manager, fully and perfectly understand the special work they have in hand. *T. C.*

**Potato Manures.**—I am this year continuing the trials of artificial Potato manures, and have already employed five kinds upon fifteen sorts of Potatoes, of each sort five rows of about 40 feet long, in ground that was trenched during the past winter, and which has not been dressed with any animal manure. The rows are 3 feet apart, and were thrown out as shallow furrows; the tubers planted, the manures sown in after, and then the soil on either side forked in. As the relative prices of the various manures should have the same proportion to nutritive value, I have employed the manures in quantities that are regulated by value only. One of the manures is simply malt dust, purchased at 6s. per bushel, and strongly recommended. Of this I used about half a bushel, as that seemed to be a heavy dressing. Of Hill's ordinary Potato manure, at 10s. per cwt., I used 4 lb.; of Hill's special manure, at 15s. per cwt., and Amies Anti-fungoid Potato manure, I employed each 3 lb.; and of Clay's Fertiliser, at 20s. per cwt., 2 lb. only was applied. It is worthy of remark, as showing the relative gravity of diverse sorts, that 2 lb. of Clay's manure was exactly of the same bulk as 3 lb. of Amies' manure, which is very heavy. I have taken every possible care to conduct this trial with fairness and impartiality, and should any one interested desire to see the effects upon the rows in the summer, I shall be most happy to show them. *A. D., Bedford.*

**Aaron's Rod.**—Mr. Roberts seems to have settled the question, that Aaron's Rod is a Mullein and not a Solidago. This was my earliest impression, conveyed by the old gardener at "The Castle" (a servant of fifty years' standing), and one is glad it should be left undisturbed in these days of changes, when even old plants have new names, and botanical ideas are apt to be upset or superseded. He was generally right, though he occasionally dropt half the name, and thus the rough scented *Dictamnus* became only the sweet-syllabled *Fraxinella* in his garden, and others shared the same fate. But the antique Mullein's flannel leaves will still represent Aaron's Rod in many an old place in "the North Country," and it is pleasant to think it should be so. *H. M. E.*

## Florists' Flowers.

**THE SOUTHERN NATIONAL AURICULA SHOW.**—Last year you permitted me to draw attention in your columns to the exhibition of the National Auricula Society, with the result of bringing to these lovely spring flowers a large gathering of spectators.

The exhibition for this year will be held in the conservatory of the Royal Horticultural Society at South Kensington on Tuesday, the 20th inst., when, from the character of the exhibits promised, the committee anticipate a display interesting alike to those whose sympathies cleave most to normal forms in Nature, and to those who delight in the developments of culture. *E. S. Dolewell, 11, Chatham Terrace, Larkhall Rise, Clapham, S.W.*

**SEEDLING GOLD-LACED POLYANTHUSES.**—Mr. Samuel Barlow, of Stakehill House, has forwarded for inspection a half-dozen blooms of seedling Polyanthuses of a very promising character; two or three of which will, if they maintain their present character, take high rank as exhibition flowers. With that care and judgment which characterise all Mr. Barlow's work of this character he has fertilised with a view of obtaining certain results, using the pollen of Lord Lincoln, Lancer, Cheshire Favourite, Exile, &c. Some of the black-ground flowers have very pure and bright golden centres, with rich black

grounds in fine contrast. One flower, named by Mr. Barlow John Bright, after his political leader, is of the highest quality. Probably some of these seedlings will come southwards on the 20th inst.

**NEW AURICULAS.**—One of these, a golden-yellow self, named Hetty Dean, is a seedling raised by the Rev. F. D. Horner, and sent to Mr. S. Barlow directly after it had bloomed. It was very promising in 1879, but this spring it has developed into a fine and striking variety, with a strong tube, good white paste, and broad golden edging. The pip sent by Mr. Barlow for inspection was twenty-five days old, and said to be the worst on a truss of eleven blossoms. It seems to furnish what is badly wanted—a fine golden self Auricula; the best in cultivation being Gorton's Stadtholder, which Mr. Horner thinks has been in cultivation some 200 years. Another is a grand green-edge, also raised by the Rev. F. D. Horner, and named Ben Simonite. It has a good tube, dense white paste, a rich black—the blackest body colour, and a distinct edge of deep yet lively green. The green-edged section of Auriculas, though including some good flowers, is not a strong one, and any additions of high-class character are to be welcomed with great satisfaction.

**PLANTING DAHLIAS.**—To thoroughly prepare ground for Dahlias, a good dressing of fresh stable manure should be given in winter and the soil thrown up into ridges. In early spring these should be thrown down with a fork, and left rough for some days. Then it should be well dug, and left rough as turned over. A week or so before planting a good dressing of decomposed stable-manure should be applied, digging it well into the soil and leaving the surface pretty smooth. In planting out some good sandy soil and leaf-mould should be placed about the roots, to give them a start. When the plants grow the side shoots should be tied out to stakes, and all flower-buds kept picked off till the plants get into size and are vigorous enough to carry good blooms. It is a mistake to plant Dahlias in poor soil, the plants get starved and the flowers are small and imperfect. To have good blooms liberal treatment is indispensable.

## Reports of Societies.

**Royal Horticultural: April 13.**—Dr. Denny in the chair. At the invitation of the Council, Mr. Shirley Hibberd delivered a short lecture on Daffodils, of which a considerable number of species and varieties were shown by Messrs. Barr & Sugden. The flowers, said Mr. Hibberd, are well known for their hardiness, and for the great variety, both in form and colour, which is to be found amongst them. They had been the favourites of old poets, whose allusions to them had always been of the most favourable kind. The collective term Daffodil, which in rural districts easily expanded itself into Daffadown-dilly, was a corruption of Asphodel, the flower the ancient Greeks devoted to the dead. The old French form of the word was Affrodille, and the initial D attached itself as a proper remainder of the preposition in the French *fleur d'affrodille*. A Daffodil being originally an Asphodel, which is a member of the tribe of Lilies, the term came to have a somewhat collective usage, and hence we find at page 44 of Parkinson's *Paradissus* the Spanish Fritillary referred to as a Daffodil. But the King's apothecary notices the misnomer as an "erreur growne strong by custom of continuance;" and in his ninth chapter on Daffodils he does his best to render the term representative of the species and varieties of Narcissi, which are members of the Amaryllis family, and in some points removed from the whole of the Lilies. The Narcissus takes its name from a blooming youth, son of Cepheus, who, being beloved by Echo and a crowd of nymphs, turned aside to make love to his own shadow in the fountain, and achieved immortality by falling a victim to his own vanity. From his delicate corpse sprang the beautiful flower which forever wears around its heart a blood-stained girdle of remembrance. It is the fair white flower with ruddy annulus, known by distinction as the Poet's Narciss, or Narcissus poeticus, that represents the story, although Ovid, who gives it in detail in the third book of his *Metamorphoses*, certainly does suggest that it might be a yellow flower, and a veritable Asphodel. But we must not be too particular about the flowers that figure in ancient fables, or we shall be soon lost in a maze of speculations. The best summary of the story, however, that the lecturer has met with is in the delightful *History of Plants* by Rembertus Dodo-næus.

The Daffodils may be said to comprise the whole

of the Narciss family, but John Parkinson warns us that there be true and false Daffodils, and at p. 67 he gives the rule to distinguish them. "Now to cause you to understand," he says, "the difference between a true Daffodil and a false is this: it consisteth only in the flower (when, as in all other parts, they cannot be distinguished), and chiefly in the middle cup or chalice; for that we doe in a manner only account those to be Pseudonarcissos, bastard Daffodils, whose middle cup is altogether as long, and sometimes a little longer, than the outer leaves that doe encompass it, so that it seemeth rather like a trunk or long nose, than a cup or chalice, such as almost all the Narcissi or true Daffodils have." Thus the Narcissi are brought before us as Daffodils of two sorts, the true and the false, the classification so far resting on the relative length of the trumpet, cup, or crown to the sepals and petals, or, as we say, to look learned, the perianth segments that encompass it.

There are in cultivation at least 150 named species and varieties of Narcissus, and Mr. Barr, one of the most active of the Narcissomaniacs, has an immense collection of seedlings for the enrichment of our collections, so that it may be safely said the next generation will have command of over 200 varieties of these delightful, useful, seasonable, glorious flowers. And shall I tell you what will appear to many as a flight of fancy, but is in truth a sober but most interesting fact? Every one of these has a history? Yes, in every good garden of Daffodils there are 200 histories represented by beautiful flowers, and the great garland, if we may call it such, is dotted and spangled and bound together with the experiences and speculations of curious students, experienced travellers, and enthusiasts of such irrepressible vitality that death alone is able to subdue them.

But these flowers, if we speak by comparison, are not so simple as they may appear. I will briefly direct your attention to one amongst a thousand problems they compel us to consider. You will observe that the centre of every true Narciss is occupied with a trumpet, a chalice, a cup, a saucer, a discus, call it what you will: the botanist calls it a crown or corona. Now, what is a corona? To this question no one living is competent to make reply; it seems as if Nature had crowned these flowers with the double purpose of exalting them and humbling the botanist. There are six divisions in the perianth, and these we may regard as consisting of three sepals embracing three petals. Then how comes the corona here? In some of the old books it is called the nectary, which is certainly not a bad guess, but it does not satisfy the severe morphologists. In the *Journal of Botany* for April, 1865, will be found a learned paper on the subject by Dr. Maxwell T. Masters, who is inclined to regard the corona as the result of a combination of two rows of modified anthers. In the issue of the same work for May, 1865, is a paper on the subject by Mr. Worthington G. Smith, who regards the corona as the result of confluent petal-stipules. But the Narciss is by no means alone in its possession of a mysterious corona. Of the 110 genera of Amaryllids there are forty-two genera equally privileged, and we have peculiarly interesting examples in *Pancreatum*, *Ismene*, *Hymenocallis*, and that exquisite Daffodil of the fertile fields watered by the mighty Amazon, the *Eucharis amazonica*, in which the faithful may behold the flowery emblem of the silvery chalice of the Lord's house, and Parkinson himself would have described it as he described the chalice of the incomparable Daffodil, saying "the cup doth very well resemble the chalice, that in former days with us, and beyond the Seas is still used to hold the Sacramental Wine." Nature has balanced the two hemispheres fairly with flowers of this kind, and if we suppose her object to be to prevent the disturbance of its equilibrium, we shall perhaps be as near the truth as at the seeming end of the speculations of our ambitious but superficial philosophy.

Another and a very great problem the Daffodils propose to us is, how shall we classify them? The student may make choice of many systems or may frame one of his own; but a perfect system is not to be hoped for, Nature herself having sternly set her face against it. And the reason of this is that throughout the family the gradations of structure and proportion are so minute that from time to time our labours fail because we cannot discover dividing lines. It is the difficulty of defining distinctive characteristics that stands sheer in the way of scientific classification. Let us, for example, take the system founded on the relative length of the corona; a system contemplated by Parkinson in 1629, and adopted by Mr. Baker in 1869. Here we find two forms of the self-same species, *Calathinus* and *Triandrus*, put into separate classes—an error which admits of correction certainly, but for the present purpose serves to illustrate the problem before us. I have myself classified these flowers according to the number of flowers produced on a stem, and the system is absolutely perfect, until—yes, until it breaks down in the presence of a plant that converts all my wisdom into foolishness by producing one or two flowers more than it ought. We know just enough

to be kept in fear that Nature will some day shatter all our plans by putting the angles where the curves ought to be, and causing two and two to count as five. If we attempt to classify by colour, in order to evade the difficulties arising out of form, we are no better off. Take, for example, the Poet's Narciss, which should be single-flowered and white, with a sanguineous centre. What shall we say of bicolor, which has two flowers and a yellow centre? And again, what shall we say of *gracilis*, which has two or even three flowers, and is wholly yellow? These two unmanageable beauties are so nearly allied to poeticus that separation, which at the first blush appears easy, proves at last to be impossible. If the varieties in their delicate gradations bring the species near together, and thus perplex us, we are not the less perplexed by the variations of the varieties themselves. Take the double *Telamonius* for example. It is sometimes destitute of a corona, forming a closely packed rosette; at other times it is double within the tube only, and occasionally it shows a perfectly single flower. In its best state, when newly imported, it demonstrates the capabilities of its native Italian clime. In its worst state, as an old-established garden flower, it gives striking indications of the deficiencies of the sub-arctic clime to which it has been transported. There is a diminutive variety of the Poet's Narciss called *Verbanensis*. It was known to Parkinson, and is by him described at p. 87 of the *Paradissus*. He had not the least suspicion of its relation to poeticus, which was discovered 200 years afterwards, and you will find it properly placed at p. 318 of the noble essay on Amaryllids of the Hon. and Rev. Dean Herber. This example is full of encouragement because if at the end of every two centuries a difficulty is disposed of, the whole catalogue of difficulties, which for the sake of argument we will estimate as numbering 500, will be all cleared off in a thousand years, and therefore the student of Daffodils is by no means tied up to a forlorn hope. There is a Daffodil described and figured by Parkinson as *Pseudonarcissus Anglicus flore-pleno*, or Gerard's double Daffodil. For twenty years I sought and sighed to possess this plant, and in the season of Daffodils haunted gardens everywhere in search of it, but all in vain. But in the spring of 1875, while pottering about the garden making notes on Narcissi, I cast my eyes in a casual way upon the adjoining meadow, and at a considerable distance descried a tuft of yellow flowers. Calling the gardener, Tippets, I said, "William, go across the meadow and see what is that yellow flower yonder." "Oh," he said with perfect confidence, "no need to go; that's only a Dandelion." But my florist's eye, in a fine frenzy rolling, was not so easily satisfied; so I went myself, and discovered in my own meadow, where I thought I knew every weed as a member of my family, a fine clump of the veritable Gerard's double Daffodil, and I dug it up and brought it into the garden, and it lives and thrives to this day. Thus we may travel round the world in search of the very flowers that we left blooming on our own doorstep; for knowledge, like charity, begins at home.

**SCIENTIFIC COMMITTEE.**—A. Grote, Esq., in the chair.

**Insects found upon Cypress.**—The Hon. and Rev. J. T. Boscawen sent further specimens of Cypress with the insects upon them, and which it is alleged eat into the young shoots and cause their destruction. Mr. MacLachlan stated that he had now examined several specimens sent by Mr. Boscawen, and was of opinion that the declining condition of the tree was not caused by the attacks of the insects in question but by the frost, injury to the root, or some other cause. The insects were of two kinds, one belonging to the Psocidæ, called *Stereopocis cruciatus*, the other an Aphid. The species of *Urosus* are not known to feed on living tissues, but only dry dead bark. There were no signs of the twigs having been gnawed by any insect.

**Plants and Specimens Exhibited.**—M. Linden sent *Anthurium Andraeanum*, a highly remarkable species from Colombia, with thick scarlet corrugated spathe, and an ivory-white spadix tipped with yellow, which is described upon another page.

Mr. B. S. Williams sent *Eria extincctoria*, noticed in our last issue, and to which a Botanical Certificate was awarded.

Messrs. Backhouse sent a potful of a handsome yellow-flowered Fritillary from the Riviera, under the name of *F. Moggridgei* (Boiss., in *Moggridgei*, *Cont. Ment.*, t. 25), and which is considered by Mr. Baker (*Journ. Linn. Soc. Botany*, xiv., p. 255) to be a variety of *F. delphinensis* of Grenier. Mr. B. S. Williams sent, under the name of *Nephrodium Lasrea membranifolia*, a Fern distributed throughout the hotter parts of India and Australia. Messrs. Veitch sent a *Masdevallia M. Chelsoxia*, a hybrid raised in their establishment between *M. anabilis* and *M. Veitchiana*. As an ornamental plant it presented no advantage over its parents. *M. Wageneriana*, a new species, was also shown. The yellow-flowered variety of *Chrysanthemum frutescens*, called *Etoile d'Or*, was shown, and its history con-

mented on. The Cranston Company sent cut flowers of a very pretty Hoya, with flowers in globose umbels; the leaves are oblong-acuminate and downy on the under-surface. The species is believed to be new, and will be named at Kew. Flowers of *Abutilon Sellowianum* were shown from Mr. George.

*Catalogue Plantarum.*—Dr. Masters showed a copy of a folio work under this title, drawn up by a society of gardeners in 1730, including Philip Miller, Thomas Fairchild, and other notable garden botanists of the day. The work is illustrated by twenty-one coloured plates, from the pencil of the famous flower-painter, Van Huysum. The purport of the book was to furnish an illustrated and descriptive "catalogue of trees and shrubs, both exotic and domestic, which are hardy enough to bear the cold of our climate in the open air." Only one part was issued, apparently under the editorship of Philip Miller. The book is mentioned in Johnson's *History of Gardening*, but is not catalogued in Pritzel, though the beauty and fidelity of the illustrations are such as to warrant it being noted in any catalogue of botanical literature.

*Effects of the Frost of the last Winter upon Plants.*—A communication was read from Mr. Elwes on this subject, with suggestions as to the best means of obtaining and tabulating the requisite information.

*Plant supposed to be Poisonous to Sheep.*—Rev. George Henslow showed a specimen of a *Carex*, supposed to have proved poisonous to sheep. In the opinion of the committee the plant had nothing to do with the disease.

*Fungus on Glass.*—Rev. George Henslow showed a specimen of an abnormal *Polyporus* found growing on the glass of a greenhouse, to which it had probably extended from the rafters.

*Fritillaria sp.?*—Rev. H. H. Crewe showed a *Fritillaria*, received from Dr. Regel, and which was referred to Mr. Baker for identification.

The meeting then adjourned.

**FLORAL COMMITTEE.**—Dr. Denny in the chair. There were not quite so many new plants as usual brought under the notice of the committees, but the proportion of good ones was somewhat larger. Next to the new plants which were certificated, and which are enumerated below, we must give the palm to two boxes of superb cut Roses, one consisting entirely of *Maréchal Niel*, large in size and lovely in colour; and the other of a mixed assortment of Teas, including such charming flowers as *Niphetos*, *Lamarque*, *Madame Falcot*, *Madame Favart*, and *Gloire de Ducher*, one of the finest of the scarlets for house work. The exhibitor was Mr. J. Walker of Thame, Oxon, and a Cultural Commendation was deservedly awarded him. From H. J. Buchan, Esq., Wilton House, Southampton, a flowering specimen of the scarce *Bifrenaria Harrisonae* Buchanan, a beautiful variety described by Professor Reichenbach in our columns last year, vol. xi., p. 430. Messrs. James Veitch & Sons showed *Croton Hawkeri*, a showy species with clear golden-yellow leaves margined with green. Mr. William Pratt, The Gardens, Hawkstone, near Shrewsbury, sent a couple of plants of *Cineraria Lady Hill*, a double-flowered variety, white tipped with violet; and from Mr. Chapman, gr. to R. S. Holford, Esq., Westonbirt, Gloucester, came half-a-dozen new varieties of *Amaryllis*, of various shades of scarlet, but not of first-class form. J. C. Bowring, Esq., Forest Farm, Windsor Forest, showed a hybrid *Cypripedium*, between *C. Roezlii* and *C. Pearcei*, but of no value. Mr. B. S. Williams again staged a nice group of *Amaryllis*, and also some fine, freely-flowered plants of the fine white *Acocanthera (Toxicophila)* spectabile. Cut blooms of a very fine dark red hybrid Tea Rose, named *Duke of Connaught*, were shown by Mr. Bennett, of Stapleford; and Mr. Sims, gr. to Edward Dann, Esq., staged a fine plant of *Abutilon Edward Dann*, which is not sufficiently distinct from others already in cultivation. Mr. Cannell again contributed some grand cut blooms of *Zonal Pelargoniums*.

#### NEW PLANTS CERTIFICATED.

First-class Certificates were awarded to Mr. J. Linden, of Ghent, for the splendid *Anthurium Andréum*, described on p. 490, and illustrated on p. 497 of the present number. To Messrs. James Veitch & Sons for *Huntleya melegris*, an old but somewhat rare South American Orchid, which is also known under Reichenbach's name of *Batemannia melegris*. The specimen shown had five of its large and strikingly singular flowers, the somewhat reflexed and pointed sepals and petals of which were yellow at the base, and brown towards the apex, and the lip nearly white. To the same firm for *Amaryllis Prince George*, one of the last batch of seedlings, as also one of the finest in point of size and effectiveness, the colour being a dark shade of crimson, with darker shaded venation; and for *Calanthe tricarinata*, a hardy species, with an erect spike of small flowers, of the same pale grass-green colour as the foliage, except as regards the lip, which is of a dark shade of brown. To Mr. B. S. Williams for a handsome and well-flowered specimen of *Choisya ternata*, a Mexican shrub, with numerous panicles of white, sweet-scented

flowers; a valuable plant for greenhouse cultivation, and which in many places has proved itself to be hardy. To Mr. B. S. Williams also for *Colens Mrs. George Simpson*, a large-leaved variety, of a rich dark maroon colour shaded with crimson. To Mr. Howard, florist, Southgate, for *Chrysanthemum frutescens, Etoile d'Or*, the new golden *Paris Daisy*, or *Marguerite*, about which there has lately been some discussion in our columns. It has a continuous and free-blooming habit, and yellow flowers of large size, and must become a popular favourite in every garden for greenhouse decoration as well as for cutting, for which latter purpose it can be strongly recommended, inasmuch as we have ourselves kept the blooms in water for a fortnight. To W. Cobb, Esq., Silverdale Lodge, Sydenham, for *Odontoglossum polyanthum*, a distinct species with a stout spike of flowers, the sepals and petals of which are lemon-coloured and blotched with chocolate, the lip broad and pale brown in colour, with a marginal white fringe, and the column white. To G. F. Wilson, Esq., for *Primrose Herman Wilson*, a large and very showy pin-eyed flower, of two distinct shades of crimson; and to Messrs. James Backhouse & Son, York, for *Fritillaria delphinensis*, a dwarf-growing species with large clear yellow flowers, which was exhibited under the name of *F. Moggridgei*.

**SPRING FLOWER SHOW.**—Though not so large a show as on the last occasion there was much to admire in the display made in the large conservatory to-day. Messrs. James Veitch & Sons received a Large Gold Banksian Medal for one of the finest groups of Orchids that has been exhibited for a long time, and which consisted of one *Ada aurantiaca*, one *Aerides Fieldingii*, three *Cattleyas*, one *Chysis Liminghii*, one *Celogyne ocellata*, one *Cymbidium Lowii*, eight *Cypripediums*, twenty-four *Dendrobiums*, one *Epidendrum*, one *Laelia elegans*, fourteen *Lycastes*, seven *Masdevallias*, including *M. Chelsoni* ×, the first garden hybrid in this genus that has been exhibited; one *Maxillaria*, fifty-seven *Odontoglossums*, nine *Oncidiums*, two *Phalaenopsis*, one *Sarcophilus*, one *Sobralia macrantha*, twenty-four *Sophranites*, and two *Vandas*—or a total number of 160 plants. Along with the Orchids were also shown some good specimens of several new white and deliciously scented *Rhododendrons*, most conspicuous amongst which were *R. Veitchii*, with flowers resembling in all but their colour a small flower of *Lilium auratum*; *R. Princess Alice*, and *R. Sesterianum*, which is even finer in shape than the former, though about of equal merit as regards floriferousness. The General Horticultural Company (John Wills) (Limited), again exhibited a very attractive group of plants, most conspicuous in which was a brilliant cluster of flowering plants of *Odontoglossum vexillarium*. A Gold Medal was awarded. A Silver Banksian Medal was the reward of Messrs. Osborn & Sons for a group of mixed stove and greenhouse flowering and fine-foliaged plants. Medals of similar value were also awarded to Mr. Aldous for a group of plants; and to Messrs. J. & J. Hayes, of Edmonton, for a group of the fine new white-flowered market *Pelargonium*, *Maid of Kent*. Messrs. Barr & Sugden exhibited cut flowers of a large number of species and varieties of *Narcissus*, probably the most complete collection that could be shown by one firm.

**Botanical and Horticultural of Durham, Northumberland, and Newcastle-on-Tyne: April 7 and 8.**—The exhibition of this Society was held in the Town Hall and Corn Exchange, Newcastle-on-Tyne. There may be societies in Britain older than this one, but probably no other has continued to hold exhibitions every year since the date of their establishment for so long a period. In 1824 this was established, and from one to three exhibitions have been held every year since. The committee work very earnestly together for the promotion of horticulture, and their efforts have so far been crowned with success. The exhibits this year were quite up to the average quality upon the whole.

*Hyacinths* were a conspicuous feature, but it could scarcely be expected that these would be up to their usual quality, nor were they, though the principal collections were scarcely behind the best exhibited in London. There was a good competition in the groups of twenty-four *Hyacinths*, and the judges had some difficulty in deciding on the relative merits of each, but ultimately gave the first prize to a well finished group from Mr. J. Thompson, nurseryman, Fenham. Messrs. H. Dewar & Co., 97, Grey Street, Newcastle, were a good 2d; and Mr. W. J. Watson, Fenham, 3d. Mr. W. J. Watson had the best *Tulips*, and they were very good indeed. In the *Polyanthus Narcissus* class Mr. J. Thompson beat Mr. Watson with a good group. In the gardeners' classes the *Hyacinths* and *Tulips* were very good. Mr. A. J. Brown, gr., Whitburn, showed a group of *Hyacinths* worthy of high commendation. Very fine, too, was a group of six *Hyacinths* from Mr. H. Sanderson, an amateur.

The stove and greenhouse plants would have been creditable to any exhibition in the kingdom. The best were sent from the gardens of H. Pease, Esq., Pierremont, Darlington (Mr. W. Yule, gr.), Theo. Fry, Esq., Woodburn (Mr. J. Noble, gr.), and from Mr. J. Thompson. *Dendrobium nobile* was splendidly flowered, *Clerodendron Balfourianum* in fine flower; *Eucharis amazonica* had about forty trusses of its charming snowy flowers, and *Cymbidium chlorocnemum* was very beautiful and well-flowered. Mr. Yule also exhibited three most beautiful and well-flowered specimens of *Rhododendron Veitchianum*, *Nuttallii*, and *Countess of Haddington*, and well they deserved the recognition of the 1st prize they obtained. *Deutzia gracilis* was represented by numerous collections. Mr. W. Brown, of Carrs Hall, gained a 1st prize for two beautiful plants; and Mr. Yule gained 1st prize also for six very fine specimens. The same exhibitor gained the highest position for six very fine examples of *Dielytra spectabilis*, a class of plants highly deserving of recognition at flower shows in spring, and of which there were numerous collections shown on this occasion. *Scillas*, *Hepaticas*, hardy *Primulas*, and such-like subjects were well represented, and amongst greenhouse plants there were good *Cinerarias*, *Cyclamens*, *Primula sinensis*, *Genistas*, *Acacias*, &c., but nothing of special merit. *Auriculas* and *Polyanthuses* call for special mention, owing to the fact that they have seldom been shown better in this district, that they were more numerous than usual, and because the growers subscribed £10 towards increasing the prizes. Many of the best varieties of *Auriculas* were shown, but there were no new seedlings worthy of notice. Mr. Woodhead, of Halifax, entered his plants, but did not exhibit. Mr. E. Adams, of Smalwell, had the best plants, next to him being Mr. H. Sanderson. In gold-laced *Polyanthuses* Mr. H. Sanderson was the most prominent exhibitor, his six plants were very fine indeed—George the Fourth (Buck) being very fine. Mr. Sanderson had some very fair seedlings, and gained the 1st prize in the class for one.

Cut flowers, exhibited in the form of bouquets and epergnes for drawing-rooms, or as button-hole flowers, were one of the most prominent features of the show. Mr. V. Wright, gr. to Grosvenor Talbot, Esq., Leeds, showed the best bridal bouquet: it was formed of white *Camellias*, *Roses*, *Spiræas*, and *Lily of the Valley*. Miss Edwards, of Seaham, gained the 2d prize with a good one, its most telling flowers being *Phalaenopsis* and white *Azaleas*. Mr. H. Wright had by far the best hand-bouquet; the centre was a blush *Rose*, and there were a few deep blue *Cinerarias* and a number of flowers of *Dendrobium nobile* in it. Mrs. Thompson, of Sunderland, exhibited a good bouquet, and gained a 1st prize in another class. In vases, of which there were sixteen, all good, Mr. M. D. Thompson, gr. to Lindsay Wood, Esq., South Hill, gained the 1st prize. *Lycopodiums*, drooping *Orchid* spikes, a few trusses of *Medinilla magnifica*, a pale blue *Clematis* and *Euphorbias* were the flowers. Mr. E. Oliver, Forest Lodge, Benton, had made an excellent arrangement, and gained the 2d prize. Mr. G. Rymer, a market gardener from Sunderland, gained the 1st prize in another class for a vase for the drawing-room. The same exhibitor gained the highest position in a class for button-hole bouquets, showing many good specimens. There were many other good examples of culture, and very fine boxes of cut flowers, but space cannot be spared for them. There ought to be more exhibitors amongst the hardy plants, as cottagers might cultivate such things as easily as the squire's gardener. For instance, only one competitor came forward to claim the prizes for *Hepaticas* where there ought to have been a dozen. It is no fault of the committee that growers of small means do not exhibit such flowers.

#### Obituary.

THE *Gardeners' Record* announces the death of Mr. THOMAS FELTON, principal of the firm of T. Felton & Son, 4, North King Street, Dublin. Mr. Felton held the responsible position of manager to the late firm of Fergus Farrell & Sons, 119 and 120, Capel Street, Dublin, for thirty-three years, and about seven years ago commenced business on his own account, taking his only son into partnership with him. For sometime past, however, his health had been in such a precarious condition that he was quite unable to look after the concern, the management of which devolved almost exclusively on his son, who will continue to carry it on as heretofore. Mr. Felton was sixty-six years of age at the time of his death, which took place on the 6th inst., at his residence, 23, Bath Avenue, Sandymount.

— We regret to have to record the death of Mr. JOHN POWELL, of the Royal Gardens, Frogmore, which took place on the morning of the 9th inst., after an attack of paralysis. Mr. Powell had been

connected with the Royal Gardens for thirty-seven years, under the late Mr. Thomas Ingram, and his successors, Mr. Rose and Mr. Jones. The department of hardy fruits was, from the first establishment of the Royal Gardens, placed under his special care, and many of the valuable novelties raised there in years gone by are to be attributed to his manipulations. Mr. Powell was not only an excellent and intelligent practical cultivator, but he was likewise a discriminating judge of fruits, and as a consequence his services have been in constant request at the Metropolitan fruit shows, where his presence will be greatly missed by those who have been for many years his coadjutors. Estimable in his private character, and kind and gentle to those who were placed under him, he made many friends, and his loss will be sincerely regretted by a large circle of professional friends, amongst whom he was well known and very highly respected. He was in his 62d year.

— Gladiolus lovers will regret to hear of the death of that eminent cultivator of their favourite flower—M. SOUCIET, and those who were privileged to enjoy his friendship will mourn the loss of "an amiable, tender-hearted man." Souchet was for many years the head gardener at the Palace of Fontainebleau, but retired from that position some ten or twelve years ago, taking up his residence in a house that he had built for himself. In the disastrous war of 1870 Souchet found that his house was not his castle, and that he had to exercise hospitality to German officers, but as all parties made the best of things no great harm was done. It is stated that when the Queen visited the late Emperor at Fontainebleau, Souchet margined the borders of the drive to the chateau with cut spikes of Gladiolus sunk in bottles of water, so as to appear as if they were growing there. Much struck by the beauty of the sight, Her Majesty is reported to have sent to Paris on her return to England for a supply of the flower, with which she was previously unacquainted. The corms so introduced are believed to have been among the earliest of the fine race of Gladioli we now possess. Souchet, we believe, had the privilege of disposing of the Gladioli he raised in the Imperial garden, but it is asserted that he would have no direct dealings with other than French firms. Whether this was a restriction imposed upon him, or whether it was a piece of exclusive patriotism, we do not know. We merely tell the tale as 'twas told to us. M. Souchet of late suffered severely, so that his death was not unexpected by those who knew him.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 16, 1880.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Deductions from Glaisher's Tables 6th Edition, WIND, RAINFALL. Rows include dates from April 8 to 14 and a Mean row.

April 13.—Fine, though cloudy till 8 P.M.; overcast, with high rain afterwards. Milder. — 14.—Overcast, dull, and wet throughout. A miserable day. Lightning seen at 8.30 P.M.

LONDON: Barometer.—During the week ending Saturday, April 10, in the vicinity of London the reading of the barometer at the level of the sea decreased from 29.58 inches at the beginning of the week to 29.33 inches by the afternoon of the 4th; increased to 29.52 inches by the evening of the same day; decreased to 29.31 inches by the morning of the 6th; increased to 30.27 inches by the night of the 9th; and decreased to 30.13 inches by the end of the week. The mean reading for the week at sea level was 29.74 inches, being 0.04 inch below that of the preceding week, and 0.18 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 58° both on the 7th and 8th, to 47° on the 10th; the mean value for the week was 53½°. The lowest temperatures of the air observed by night varied from 34½° on the 8th, to 41° on the 4th; the mean value for the week was 37½°. The mean daily range of temperature in the week was 16°; the greatest range in the day being 23½° on the 8th, and the least 10½° on the 10th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—April 4, 47°.7; + 2°.9; 5th, 45°.4, + 0°.5; 6th, 42°.6, — 2°.4; 7th, 44°.6, — 0°.6; 8th, 43°.7, — 1°.7; 9th, 43°.6, — 2°; 10th, 41°, — 4°.7. The mean temperature of the air for the week was 44°.1, being 1.1 below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 123° on the 7th, and 121½° on the 8th; on the 6th, 9th, and 10th, the readings did not rise above 70°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 30½° on the 8th, 32½° on the 7th, and 33° on the 10th; the mean of the seven lowest readings was 34°.

Wind.—The direction of the wind was W. and E.N.E., and its strength strong at times.

The weather during the week was generally fine, though frequently dull and showery.

Thunder was heard both on the 6th and 8th, and lightning was seen on the 8th.

Rain fell on four days; the amount collected was 0.41 inch.

ENGLAND: Temperature.—During the week ending Saturday, April 10, the highest temperatures of the air observed by day were above 60° at Cambridge, Nottingham, Leeds, and Sunderland, and below 54° at Bristol and Liverpool; the mean value from all stations was 58°. The lowest temperatures of the air observed by night were below 34½° at Blackheath (London), Leicester, Cambridge, Wolverhampton, Nottingham, and Hull, and above 39° at Plymouth and Sunderland; the general mean from all places was 36°. The extreme range of temperature in the week was above 28½° at both Cambridge and Nottingham, and below 18° at Plymouth, Bristol, and Liverpool; the mean range of temperature from all stations was 22°.

The mean of the seven high day temperatures was above 54½° at Plymouth, Cambridge, Nottingham, and Sunderland, and below 51½° at both Bristol and Liverpool; the mean value from all places was 53½°. The mean of the seven low night temperatures was below 38° at Blackheath, Wolverhampton, Nottingham, and Hull, and above 42° at both Truro and Plymouth; the mean from all stations was 39½°. The mean daily range of temperature in the week was above 17½° at both Cambridge and Nottingham, and below 12° at Truro, Plymouth, Bristol, Sheffield, and Liverpool; the mean daily range of temperature from all places was 14°.

The mean temperature of the air for the week from all stations was 45°, being 31° higher than the value for the corresponding week in 1879. The mean temperature was above 46½° at Truro, Plymouth, and Sunderland, and below 44° at both Wolverhampton and Hull.

Rain.—The heaviest falls of rain during the week were at Plymouth 1.15 inch, Truro 0.95 inch, Bristol 0.90 inch, and Leeds 0.88 inch, and the least falls were at Liverpool, 0.03 inch, and Sheffield 0.01 inch; the average fall over the country was half an inch.

The weather during the week was generally fine, though dull, cloudy, and showery. Thunder was heard at several places during the week.

SCOTLAND: Temperature.—During the week ending Saturday, April 10, the highest temperatures of the air observed by day varied from 57° at Dundee, to 51¼° at Aberdeen; the mean from all places was 53½°. The lowest temperatures of the air observed by night varied from 28° at Paisley and 29¼° at Perth, to 36° at Greenock; the mean value from all stations was 33°. The mean range of temperature in the week from all places was 20½°.

The mean temperature of the air for the week

from all stations was 44½°, being 2½° higher than the value for the corresponding week in 1879. The mean temperature was the highest at Dundee, 45°, and the lowest at Perth, 43¼°.

Rain.—The amounts of rain varied from 1.08 inch, at Paisley, and 0.90 inch, at Greenock, to 0.22 inch at Aberdeen; the average fall over the country was half an inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—Eccles.

TOBACCO PAPER: Nicotine is desirous of obtaining a good recipe for making tobacco-paper, which some of our readers may perhaps be able to give; though we should doubt its advantage to him unless he is a tobacco manufacturer.

Answers to Correspondents.

ALANTUS GLANDULOSA: E. W. Davis. The tree is a native of Japan and Mongolia, where it bears the vernacular name of "Ailanto," literally "Tree of Heaven." We cannot reply definitely to your other question.

BACHELORS' BUTTONS: A. D. S. This popular name is given in different places to different plants; but perhaps most generally to the double-flowered forms of Ranunculus acris. The other plants sometimes so called are Lychnis diurna and L. sylvestris, Scabiosa succisa, Centaurea nigra, and double white Daisies.

CYCAS: G. A. B. Cycas revoluta is not classed as a Palm, neither is Zamia nor Encephalartos. They belong to the group of Cycadaceae, and are popularly called Cycads.

FLOWER SHOWS: A. W. Taylor. No. The Horticultural Directory contains a list of societies, but does not give the dates on which their shows are held. It would be impossible to do so, because in very many cases the dates are not fixed until late in the season.

NAMES OF PLANTS: J. C. E. 7. Asplenium lucidum; 8. Davallia pycnidata; 9. Asplenium filicoides; 10. Onoclea sensibilis.—R. T. A small, somewhat crose (i.e., slightly depauperated) form of Pteris serrulata, which, as far as the present specimen testifies, is not worth a distinctive name.—J. McD. Epimedium pinnatum.—S. S. Primula verticillata var. sinensis.—C. Roe. The large flower is Doronicum caucasicum, and the small one Ranunculus ficaria.—G. Croston. Gardenia intermedia, we should think.—J. O. E. 1. Primula verticillata; 2. Ruscus aculeatus; 3. Ribes sanguineum; 4. Polypodium vulgare; 5. Polystichum angulare; 6. Lastrea Filix-mas; 7. Lastrea dilatata.—J. T. 1. Cheilanthes elegans; 2. Acaulpha tricolor; 3. Aloesia jenningsii; 4. Eranthis rubronervium.—H. J. 1 and 2. Odontoglossum gloriosum; 3 and 4. Odontoglossum praestans, two varieties.—An Amateur. Eltham. 1 and 3. Ophrys tenthredinifera; 2. Orchis papilionacea; 4. Orchis longicirrus; others not fresh enough.—M. J. Pittosporum tenuifolium.—H. Fisher. Helleborus foetidus. We wish every one would send us as good a specimen as you.—H. C. 2. Lycopodium volubile; 3. Lomaria alpina; 5. a moss, which is undeterminable without fruit; 6. Asplenium flabellifolium; 1 and 4. undeterminable without flowers.—H. J. Ross. The yellow one is Dendrobium aggregatum probably; the white and yellow D. Pierardii.—T. S., Leadenhall Street. Sarracenia flava, a native of North America, not New Zealand.—Geo. Tate. Fuchsia splendens.—Cestrian Subscriber. 1, a garden variety of Hippastrum which we cannot undertake to name; 2. Doodia caudatum; 3. Adiantum tenerium.

PEACHES NOT SWELLING: H. S. The cause is probably to be attributed to immaturity of the wood—the result of the last sunless and dripping summer.

PRIMROSES: Cannon & Reid. A batch of large, showy, varied, and in many cases high-coloured varieties, admirably adapted for border decoration, but the majority of them are pin-eyed, and of no value from a florist's point of view. The few gold-laced flowers are very imperfect, being either too small, pin-eyed, not uniform in the colour of centre and lacing, or not having the lacing cutting clean through the centre of the lobes. The whites, and some of the narrow crimson, are especially fine as border flowers.

ROSE BONES: Rosarian. We do not know where you can buy these ready made. A box to hold twenty-four blooms should be 3 feet 9 inches long and 18 inches wide; 6 inches high at the back and 4 inches in front. Half this length will make a stand for twelve, and one-fourth for six, but the width and height must be the same.

SELD DRILL: B. Cosmbe. We have never seen such a drill as you enquire about, but if there is such an one for sale you should be able to get it at S. & E. Ransome & Co.'s, 10, Essex Street, Strand, W.C.

VINES: J. T. It would seem, from three of the Vines only having suffered, that it must be the result of some local injury to the roots. We can, therefore, only advise you to examine them carefully, and probably the best course to adopt will be suggested to you.

ZONAL PELARGONIUMS: M. J. T. Strictly speaking, a Zonal Pelargonium is one of those which have the leaves marked with a zone or band, usually of a dark brown colour, but sometimes dark green or greyish-

green, forming what is called the horse-shoe mark on the leaf. In olden times these Zonal Pelargoniums were known as Horse-shoe Geraniums; these, however, have now become so completely mixed up with the race represented by the old Tom Thunb, which has no zone, that for grouping purposes all the Pelargoniums of the types zonale and inquinans are indiscriminately called Zonals.

COMMUNICATIONS RECEIVED.—S. M. & A. (thanks).—T. C.—G. F. M.—C. M. (thanks)—W. D.—J. C.—J. B.—W. F.—H. L. & Co.—T. B.—W. B. H.—J. R. J.—J. M. C.—R. L.—H. J. B.—S. W.—J. Mc. B.—A. T.—J. Page.—J. S.—C. C.—E. C.—C. W. V.—J. J.—S. W.

DIED, on the 13th inst., at 1, Gilston Road, London, ROBERT FORTUNE, Oriental Traveller, Botanist, and Author, aged 67.

On April 4, at The Nurseries, Chipstow, WILLIAM MORRIS PILLINGER, aged 43 years, deeply regretted.

Markets.

COVENT GARDEN, April 15.

We are now having a good supply of new Grapes, both home-grown and from the Channel Islands, quality generally being good; also Strawberries and all kinds of indoor vegetables, quite equal to the demand. Trade somewhat better. James Webber, Wholesale Apple Market.

FRUIT.

Table with 4 columns: Fruit name, Price (s. d.), Fruit name, Price (s. d.). Includes Apples, Oranges, Pears, Pine-apples, Strawberries, Lemons.

VEGETABLES.

Table with 4 columns: Vegetable name, Price (s. d.), Vegetable name, Price (s. d.). Includes Artichokes, Asparagus, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Endive, Garlic, Herbs, Potatoes, Turnips.

PLANTS IN POTS—WHOLESALE PRICES.

Table with 4 columns: Plant name, Price (s. d.), Plant name, Price (s. d.). Includes Arum Lilies, Azeleas, Begonias, Bouvardias, Cinerarias, Cyclamen, Cyperus, Dielytra, Dracæna terminalis, Erica, Euonymus, Ferns, Ficus elastica, Foliage Plants, Geminia, Hyacinths, Myrtles, Palms, Pelargoniums, Spiræa.

CUT FLOWERS—WHOLESALE PRICES.

Table with 4 columns: Flower name, Price (s. d.), Flower name, Price (s. d.). Includes Abutilon, Arum Lilies, Azalea, Bouvardias, Camellias, Carnations, Cyclamen, Epiphyllum, Eucharis, Euphorbia, Gardenias, Heliotropes, Hyacinths, Lily of Val, Mignonette, Narcissus, Pelargoniums, Primroses, Roses, Spiræa, Tulips, Violets.

SEEDS.

LONDON: April 14.—There is now an active seasonable business doing. Prices all round keep very moderate. Canadian Clover seed, in particular, being unprecedentedly cheap: the supply still exceeds the demand. Alsike is also this season most reasonable. Considerable steadiness characterises white Clover seed. Trefoil and Italian are both somewhat easier. Perennials steady. Lucerne, Timothy, and Sainfoin are scarce and firm. For spring Tares there is a good sale at full rates. A few Scotch Gore Vetches, of extraordinarily large size, are now offering. Mangel seed is in increasing request. No change in bird seeds. The trade for blue Peas is improving. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

Lawn Mowers — Lawn Mowers.

THE GREAT SUPERIORITY OF GREEN'S PATENT "SILENS MESSOR" AND "MONARCH" LAWN MOWERS

Over those of all other Markets is universally acknowledged. They will Cut Either Short or Long Grass, Bents, &c., Wet or Dry.

These advantages no other Lawn Mowers possess. They have been in constant use for upwards of twenty years in The Royal Gardens, Windsor, Puckingham Palace Gardens, The Hyde Park Gardens, Marlborough House Gardens, Hampton Court Gardens, Royal Horticultural Society's Gardens, South Kensington, The Zoological Gardens, The Royal Botanic Gardens, The Regent's Park, The Dublin Botanic Gardens, The Liverpool Botanic Gardens, The Crystal Palace Company's Gardens, The Botanic Gardens, Brussels, The Winter Palace Gardens, The Hull Botanic Gardens, Dublin, The Leeds Horticultural Gardens. And in most of the Principal Parks and Squares in the United Kingdom.

They are the simplest in construction, the easiest to work, the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant.

The above machines have proved to be the best, and have carried off Every Prize in all cases of Competition. Every Lawn Mower is guaranteed to give entire satisfaction, otherwise it may be returned at once, free of cost to the purchaser.

The largest stock of Mowers kept in London, and including all sizes from 6 inches to 48 inches, is to be seen at our London establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, and have their orders executed the same day they are received.

Table with 3 columns: Mower size, Workability, Price (£ s. d.). Includes 'To cut 6 inches', 'Can be worked by a lady', 'Can be worked by one person', 'This can be worked by one man on an even lawn', 'By man and boy'.

Prices of Horse, Pony, and Donkey Machines, on application. They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the manufacturers. Carriage paid to all the Principal Railway Stations in the United Kingdom.

Illustrated Price LISTS free on application. N.B.—These who have Lawn Mowers to Repair will do well to send them either to our Leeds or London Establishments, where they will have prompt attention, as an efficient staff of workmen is kept at both places.

GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths. SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Table with 4 columns: Diameter, Length, Price (£ s. d.). Includes 'Diam. 16 in. by 17 in.', 'Diam. 20 in. by 22 in.', 'Diam. 24 in. by 26 in.', 'Diam. 30 in. by 32 in.'.

Prices of Rollers fitted with Shafts, suitable for Horse and Pony, on application.

They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers, THOMAS GREEN AND SON (Limited), SMITHFIELD IRONWORKS, LEEDS. And 54 and 55, BLACKFRIARS ROAD, LONDON, S.E.

Carriage of Rollers Paid to all the Principal Railway Stations in Great Britain.

By Permission of the Hon. Board of Customs. (Free of Duty.)

CORRY & SOPER'S NICOTINE SOAP (PATENT)

An effectual and speedy Eradicator of Scale, Thrips, Green Fly, Mealy Bug, Red Spider, American Blight, and all Parasites affecting Plants, without injury to Foliage.

It may be used with perfect safety and efficiency for the Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the Coffee Plant.

The Proprietors have great pleasure in bringing to the notice of Horticulturists generally this valuable preparation, the basis of which is Nicotine, or the Oil of Tobacco, with which is blended other essential ingredients, to render it available as a general INSECTICIDE.

It has now undergone a thorough test by some of the most practical men in Horticulture, and it is proved beyond all doubt that no Insecticide will bear comparison to it for killing properties with Perfect Safety to Foliage.

It may be used as a Dip or Wash for any description of out or indoor Plants, and as a Dressing for the Bark of Fruit Trees, Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from some hundreds lately received from men of considerable experience.—

Messrs. J. & J. HAYES, Nurserymen, Edmonton, London, N., on Feb. 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who have anything to do with plants or fruit growing, as it is so very useful for dipping and syringing when it is not convenient to fumigate. You are quite at liberty to make what use you please of this."

Messrs. OSBORN & SON, The Fulham Nurseries, London, write:—

"We have given your Nicotine Soap a fair trial, and our experience confirms the character you give it, that it is an unrivalled preparation for killing insect life, without injury to plants."

Mr. B. MALLER, Burnt Ash Nursery, Lee, London, S.E., on Feb. 21, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must now say it is very satisfactory. I am now having it used freely for syringing, 1/2 pint to 4 gallons of water, without the least injury to the foliage."

Mr. J. C. SYMERS, Orchid Grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, on Nov. 24, 1879, writes:—

"I have now tried in many ways your Nicotine Soap as an insecticide for Orchids, and it has given me great satisfaction," &c.

Messrs. BARNWELL & TILBURY, Nurserymen, Worthing, on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we can with pleasure say it is the most useful insecticide that has ever come under our notice. We have tried it on Strawberry plants when in bloom, and find it most effectual in destroying the fly, whilst it does not in the least injure the plants or flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ARBEE, Gardener to C. M. Palmer, Esq., M.P., Green's Park Garden, South-by-the-Sea, on February 20, 1880, writes:—

"The Nicotine Soap I had from you I find a safe and powerful insecticide, being destructive of every kind of insect infesting plants, and in no instance has any injury been done to the foliage. At a strength of 3 oz. to a gallon of water, I have used it for syringing Peaches during growth for the destruction of red-spider, without injury in any way (only to the insect—which it instantly kills). At that strength to 4 oz. to the gallon it may, with perfect safety, be employed for syringing every description of fruit tree, whether under glass or outdoor, and a majority of plants, without the least injury, whilst at the same time it destroys aphides—green, brown, blue, and black—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon of water, I have employed it very successfully for destroying mealy-bug, brown and white scale, both by syringing the plants and applying with a brush, its effects upon the insects making its application gratifying; whilst from its grateful smell, it is pleasant than otherwise. At a strength of 8 oz. to the gallon I found it a first-rate winter dressing for fruit trees, mealy-bug on Vines, as well as a de-troyer and preventive of red-spider, thrips, and aphides. It also destroys American blight."

The following Nurserymen authorise us to say they have used the Nicotine Soap with unqualified satisfaction:—

J. Laing & Co., Forest Hill, London, S.E.; Hawkins & Bennett, Twickenham, S.W.; G. Edwards, Balham, S.E.; James Walton, Lee, S.E.; D. S. Thomas, Wimbledon, Surrey; F. & A. Smith, Dulwich, S.E.; J. Peck & Son, Roupell Park, Lower Norwood, S.E.; G. Brand, Winchmore Hill, N.; Hooper & Co., Covent Garden, W.C.; Lucombe, Pince & Co., Exeter; Edwin Cooling, Derby; T. Frost & Sons, Maidstone; W. C. Drummond, Bath; G. & W. Yates, Manchester; W. Bryant, Rugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aberdeen; J. Charlton, Tunbridge Wells; Edmonson Bros., Dame Street, Dublin, &c.

Sold in jars, 3 oz., price 1s. 6d.; 20 oz., price 3s.; and in tins, 14 lb., price 15s. 6d.; and drums, 28 lb., price 25s.; 56 lb., price 50s.; 112 lb., 95s. Full directions for use on each package.

And 2 oz. sample jars, 6d. each.

Full directions for use on each package.

Manufacturers of Tobacco Powder, Tobacco Juice (duty free), Tobacco Paper and Cloth, and Horticultural Sundriesmen.

May be obtained from all Seedsmen and Florists.

Wholesale from the Manufacturers, CORRY & SOPER, BONDED TOBACCO STORES, SHAD THAMES, LONDON, S.E.

# GYDE'S IMPERIAL FERTILISER.

Established 1839. Forty Years of Increasing Success.

Perfection in Artificial Manures for all Flowers, Fruits, & Vegetables.

Numerous Testimonials from all parts of the Kingdom justify us in stating that our Manures and Plant Foods are Perfect.

**GYDE'S IMPERIAL FERTILISER IS ESPECIALLY ADAPTED FOR VINES.**

Some Manures give beauty of bloom at the expense of the plant's vitality, causing a consumption of the strength of the plant's stamina and roots, producing, as it were, a hectic flush of short duration; but in every case the bloom on a plant nourished on GYDE'S IMPERIAL FERTILISER is a proof of sound health.

EXTRACT FROM "CHRISTIAN ANNUAL," 1880.

PLANT AND FLOWER CULTURE.—A special manure for plants and flowers, and garden produce is produced by the Stroud Chemical Manure Company, which has already established much repute, and should be in great demand on its own merits at this season. The failure which fell last year to a large extent on fruits and vegetables, as well as corn, must have the effect of giving a keener feeling to past experience of the efficacy of "Gyde's Fertiliser," leaving no doubt of the great value of this manure. At least one hundred of the most extensive and qualified plant growers have given their names as references in corroboration, from their own experience, of the remarkable and satisfactory results of this powerful and convenient agent. Though of a special character, the manure has a wide and varied applicability. It has been found of prime excellence

for Vines, Fruit Trees, Flowers, Vegetables, Strawberries, Horticultural Plants of every kind, and for all Kitchen Garden Crops. Nothing can be better also for dressing lawns. The "Imperial Fertiliser" produces health and beauty wherever it is applied round the walls, windows, greens, and conservatories, of our dwelling-places, whether on a large or small scale; and it has certainly the merit of having added a substantial charm to horticulture in all its branches. The "Fertiliser" is sold in  $\frac{1}{4}$ ,  $\frac{1}{2}$ , and 1 cwt. bags, or in tins as small as 1s. each; and we cordially commend its use, confident of the satisfactory effects of the experiments to all who, like ourselves, have been not a little puzzled of late years by the stiffness of their Vines and Fruit Trees, the blight of their flowers, and the general decadence of their garden produce.

1 cwt., 16s.;  $\frac{1}{2}$  cwt., 9s. 6d.;  $\frac{1}{4}$  cwt., 7s.; 14 lb., 5s.; 7 lb., 3s. 6d.; Tin, 1s.

To be obtained of the principal Florists and Seedsmen throughout the kingdom.

London Office:—27, Crosby Hall Chambers, Bishopsgate, E.C.; or direct from the Works, Stroud, Gloucestershire.

MANUFACTURED BY THE STROUD CHEMICAL MANURE COMPANY,

W. TRINDER, Manager.

The attention of the Public is invited to "THE COVENTRY" LAWN MOWER, which can be confidently recommended as the best and cheapest in the market; for lightness and ease in working it cannot be surpassed. It has all the improvements which have of late been introduced into this class of Machine, either in England or America. It will cut wet or dry grass of any length, will turn in its own width, and is so light that a lady can use a 15-inch Machine of this make with greater ease than a 10-inch of the ordinary kind. It is cheaper than any other Machine of its class before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with rollers at same price, and with Grass Boxes at a small extra cost.

TWO GOLD MEDALS  
Awarded to us by  
Royal Horticultural Society,

At the Grand Show at Preston,  
July, 1878.  
Out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last

a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

R. HALLIDAY & CO., Royal Horticultural Works, MIDDLETON, MANCHESTER.

WHOLESALE RUSSIA MAT WAREHOUSE. Importers of RAFFIA FIBRE, TANNED NETTING, 1, 2, and 4 yards wide.—MARENDAZ AND FISHER, James Street, Covent Garden, W.C.

Hurry's Daisy and Weed Extractor, FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little invention.

The following particulars, from the Gardener's Chronicle of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of Mr. ALFRED F. O'C. HURRY, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: THOMAS TILLEY, 12, Walbrook, London, E.C. Cambridge Agents: G. BEALES & CO.

Or Carriage Free of the Inventor on receipt of P.O.O. for 4s. 3d. and 5s. 3d., payable at Cambridge or Sawston.

F. AND J. SILVESTER, Castle Hill Foundry, Engineering and Boiler Works, Newcastle, Staffordshire.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.	To heat of 4-in. Pipe.	Price.		
High. 20 in.	Wide. 18 in.	Long. 18 in.	Feet. 300	£ s. d. 7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

Gentlemen consulting this Catalogue have the advantage of inspecting designs whose efficiency has been tested by actual experience.

Oil Paint No Longer Necessary. HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c. sent free on application to

KINAHAN'S LL WHISKY.

KINAHAN'S LL WHISKY. Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

KINAHAN'S LL WHISKY. Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."

KINAHAN'S LL WHISKY. Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.

HOLLOWAY'S OINTMENT AND PILLS.—When the spring succeeds the winter, countless causes are at work to lower the tone of the nervous system, which will be followed by ill-health unless proper means be employed to avert that evil. Holloway's far-famed preparations supply a faultless remedy for both external and internal complaints connected with change of seasons. All affections of the skin, roughness, blotches, pimples, superficial and deeper seated inflammations, erysipelas, rheumatic pains, and gouty galls, alike succumb to the exalted virtues of Holloway's Ointment and Pills. The maladies most prevalent in spring, to wit, chest complaints and stomachic ailments, daily bear witness to the potential influence of this treatment, which saves suffering and spares disaster.

The adornment of "ladies faire,"—A beautiful head of hair. The manliness of "brave man,"—Whiskers and Moustaches. No more Disappointments Beware of Worthless Preparations. Of what value is their guarantee? As it should be. Quality and Quantity. Compare and see. The COMME IL FAUT CAPILLARY GERMINATOR (Warde's Real Hair Producer). Remember the title, and use no other. The fashionable journals write in its favour.

The "Court Journal" says:—"The Comme il faut Capillary Germinator must evidently be a severe thorn in the sides of the distributors of would-be hair 'restorers' and 'germinators,' and very properly so, for it has proved itself to be the only article that has given thorough satisfaction to numbers who have sought the use of many advertised preparations. After severe trials, the Comme il faut Capillary Germinator (the most honest of appellations) has satisfied its patrons that it is as speedy in its operation as it has been satisfactory in its ultimate results, in regard to the production of a capillaceous growth (a beautiful head of hair, whiskers, moustaches, and eyebrows). A sure preventive of baldness." The "Court Circular" says that it is "The most genuine and most reliable of the Capillary Germinators or Hair Restorers before the public."

AS IT WAS, AS IT IS, BEFORE USE, AFTER USE. This desirable effect, a BEAUTIFUL HEAD OF HAIR, WHISKERS, MOUSTACHES, and EYEBROWS, Invariably brought about by the use of The COMME IL FAUT CAPILLARY GERMINATOR (Warde's Real Hair Producer). Sent free, to any address, upon receipt of remittance, value 2s. 6d.; three bottles, 6s. Directions for use with each bottle. Sole Proprietors, C. WARDE & CO., 16, Great Marlborough St., London, W.

The COMME IL FAUT CAPILLARY GERMINATOR (Warde's Real Hair Producer)

is not a new discovery. The secret of its composition has been acquired by purchase from a retired physician of eminence, who for many years used it so successfully in his practice as to cause no small amount of astonishment from the witnesses of the remarkable metamorphosis invariably brought about by its use. As the result of its alimentary properties, it stimulates apparently decayed hair-balls, is a renovator of the natural colour of the hair, prevents baldness, keeps the hair from falling out or turning grey; is a cleanser of the scalp, is a radical cure for scurf and dandruff, is perfectly harmless, and is the most refreshing and invigorating of hair washes (for which purpose one tea-spoonful to half-a-pint of water will be found sufficient). It acts as an emollient, thereby removing all harshness from the hair, to which it gives a luxuriant growth and beautifully soft texture. It contains no oleaceous matter whatever. Persons visiting warm climates should take a supply with them, as it counteracts the injurious effects of the sun upon the capillature.

THE COMME IL FAUT CAPILLARY GERMINATOR (WARDE'S REAL HAIR PRODUCER) can be procured for you by any Chemist from the Wholesale Houses, viz., SANGER'S, NEWBERRY'S, EDWARDS'S, BARCLAY'S, HOVENDEN'S, SUTTON'S, MAW'S, &c.

The Words COMME IL FAUT and WARDE'S in connection with CAPILLARY RESTORERS, &c., are protected to the Proprietors by Registration ACCORDING TO LAW. None genuine without our signature, thus

Warde & Co., TO IMITATE WHICH IS FORGERY.

"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—137, Fleet Street, E.C.

14,917 Cures of Asthma, Consumption, Bronchitis, and all Disorders of the Throat and Lungs, Rheumatic, Hysterical, Nervous and Heart Complaints, by DR. LOCOCK'S PULMONIC WAFERS, have been published in the last twelve months. The benefit to society which has resulted from the discovery of this medicine is, however, far greater than these figures show, as many thousands of cures are effected and not made public. Dr. Locock's Waters taste pleasantly. Prices from 1s. 1/2d. to 11s. Sold by all Druggists.

DINNEFORD'S MAGNESIA. The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION, and as the safest Aperient for Delicate Constitutions, Ladies Children, and Infants. DINNEFORD'S MAGNESIA.

SEND FOR A PRICE LIST OF

# JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

*For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms.*

No Cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.

No Oiling or Packing Required.

Made in sizes to raise from 300 to 500,000 Gallons per day.

*This Advertisement will appear again on May 8.*

*This Advertisement will appear again on May 8.*

This Ram for small working falls.

This Ram will force a part of the same water that works it, or will force clean water from a well or spring whilst worked by a stream of impure water. Rams on this principle can be supplied to force to a height of 1500 feet.

This Ram, for deep working falls, will force up one-third of the water passing through it.

*Parties requiring a Water Supply should not too readily conclude that the quantity and fall of water, if any is available, is too small to work a Ram before consulting J. B.*

## TESTIMONIALS.

*From the Right Honourable the EARL of GRANARD, Castle Forbes, March 1, 1880.—“The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of a tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground, but I have been most agreeably undeceived.”*

*From Col. TREMAYNE, Perran-a-Worthel, Cornwall, March 7, 1880.—“The Self-acting Hydraulic Ram you erected here about two years ago is, I am pleased to say, working most satisfactorily, sending up water at the rate of 8000 gallons to a height of 183 feet, and a distance of more than 2000 yards. The quantity of water is as much as you undertook to deliver.”*

*From W SCARTH, Esq., Agent to His Grace the Duke of Cleveland.—“Raby Castle, Darlington, July 16, 1878.—“The Hydraulic Ram you supplied to his Grace the Duke of Cleveland in 1875 is a complete success. It worked for more than two years without once stopping, and throws more water than promised.”*

*From JOHN TAYLOR, Esq., The Rocks, Bath, August 22, 1878.—“The Self-acting Hydraulic Ram you fixed here in March of last year continues to work well. It has only the same quantity of water and fall to work it as the water-wheel and pump which I used previously to force a height of 204 feet, and yet the Ram sends up more than double the quantity of water that the wheel did to the same height.”*

*From MEJY STARRIE, Lovely Hall, Blackburn, May 13, 1878.—“Sir, I have great pleasure in testifying to the good qualities possessed by the Ram you erected here last year. It has done its work well, and not failed as the other Ram did, which was of a different construction, and supplied by a different firm. I consider that there are great difficulties to contend with here, but your practical mechanical knowledge, both as to the construction of the Ram and its situation here, overcame most of the difficulties that we had to contend against.”*

*From JOHN PENNINGTON, Esq., Emmott Hall, near Colne, December 21, 1868.—“Sir.—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force-pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water.”*

This view represents one Ram worked by water from a spring, and forcing it up to a Farm, Cattle Troughs, Kitchen Garden, and Mansion, all at different elevations, the highest being 444 feet, and to a distance of 2008 yards.

## TESTIMONIALS.

*From Capt. GANDY, Castle Bank, Appleby, February 11, 1880.—“The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forces water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week.”*

*From JOHN WALKER, Esq., Mount St. John, Thirsk, February 13, 1880.—“In reply to your enquiry I am glad to inform you that the Hydraulic Ram you fixed here in May last has fully answered my expectations, and your promises as to the quantity of water it would force to a height of 185 feet. I consider it a very good machine, and superior to one I had in use previously.”*

*From Captain TOWNSEND, Wincham, February 10, 1877.—“In answer to your enquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe, 900 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000.”*

*From the Right Hon T. SOTHERON-ESTOURT, Estcourt Park, Gloucestershire, September 6, 1875.—“You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful.” (The delivery pipe in the above case is 4200 feet long, with 120 feet rise.)*

*Deane Water, Wilmslow, November 23, 1873.—“Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required—namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—Yours, &c., L. HANMER.”*

*From Mr. THOMAS MASON, Alkincoates Hall, Colne, September 30, 1871.—“Sir,—Your Self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours, to a height of 194 feet.*

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

## NEW PINE-APPLE—"LORD CARRINGTON."

# MESSRS. JAMES VEITCH & SONS

Beg to announce that they have arranged to send out this splendid new Pine-apple, which has been under cultivation by Mr. Miles, of Wycombe Abbey, during the past seven years. It is an exceedingly handsome, highly flavoured fruit, and a most excellent variety for autumn and winter use.

It received the award of a *First-class Certificate* from the Fruit Committee of the Royal Horticultural Society in January, 1877, and a *Silver Medal* of the Society in October, 1878, when five fruits, weighing 28 lb., were exhibited.

The following extracts will serve to point out to Cultivators the merits of this fine novelty:—

"Mr. Miles, of Wycombe Abbey Gardens, sent (Royal Horticultural Society's Meeting, October 16) five fine specimens of Lord Carrington Pine-apple, to which a First-class Certificate was awarded last year, and now a Silver Medal for the present exhibition. It is a distinct and handsome Pine, valuable for its good keeping properties." *Journal of Horticulture*, October 17, 1878.

"From Mr. Miles came five exceedingly fine fruits of Pine-apple Lord Carrington. The fruit is very handsome in appearance, is of excellent flavour, and has, besides, the merit of being the best keeping variety in cultivation, and which, on that account, is well deserving the attention of growers in the Azores." *Gardeners' Chronicle*, October 19, 1878.

A limited number of vigorous plants, 42s. each; smaller ditto, 21s. each.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

SATURDAY, APRIL 24, 1880.

SIR TREVOR LAWRENCE'S ORCHIDS.

(Continued from p. 424.)

THE house No. 4, in size and height forms a counterpart of No. 3. The first plant that catches the eye and excites the admiration of the Orchidophilist is called *Dendrobium Falconeri giganteum*. It is quite a gigantic *Falconeri*, looking at the flowers, but the pseudobulbs partake more of the character of a stout Devonianum. Unlike *Falconeri* the bulbs have no nodes, and they do not elect to shoot off subsidiary branches at right angles. Moreover the flowers are larger, much more telling in colour and better lusters than *Falconeri's* beautiful *Dendrobe*. This is a veritable acquisition, and might very properly bear a specific name. Some extra well grown pieces of *D. crassinode* were situated in this temperature—very good, many of them, as varieties. Everybody now has a *Barberianum*, but not always of extra quality; here it was very pronounced, and *D. crassinode album* was a noteworthy plant—in truth the members of this species were all exceedingly well under hand. The same remark applies to the beautiful although short-lived flowered Devonianum. Another extra good thing when the variety is selected is *D. Findleyanum*. There is a softness about the colours and a finish about the kidney-formed lip of this flower that is quite captivating taken together with the soft yellowish cast of its gouty-looking pseudobulbs. The short stumpy but withal handsome when in flower *D. capillipes* was well represented, and many others. Particularly fine were the plants of *Zygopetalum maxillare*. They had taken possession, many of them, of 3 feet lengths of dead Tree Fern boles, and were going along as cultivated plants ought to do in a proper element. The pseudobulbs were increasing in dimensions until not a few of them were distended to the size of good hen eggs, surmounted with leaves of unexceptional greenery and health. I counted on one plant some fourteen extra fine pseudobulbs, connected together at short distances with short horizontal rhizomes. *Calanthe Dominionum*, of the *Masuca* class, was in rude health, and the rather pretty white and ruddy-crested *pleiochromum*, along with *Miltonia Clowesii* and *Cymbidiums* of the *Mastersii* and *eburneum* class, with a very pretty plant of *Cattleya dolosa*, of the *bulbosa* type, were prominent plants.

No. 5 HOUSE.

Passing out of this house we came to a counterpart of No. 2, with low roof by comparison to No. 4, path up centre, with stage on either side, equally clean and smart. This is an intermediate-house, *Cattleyas* predominating; chief among the novelties was one called *Cattleya Trianae veniflora*?—why so, one without seeing it in flower cannot easily determine. Notwithstanding, it was a little giant in its way, with

obese pseudobulbs, shining and lusty, like a well-grown Sion House Cucumber. Here, too, was the tinted-leaved *Cattleya labiata* (how scarce the old autumnal-flowered green-leaved one is!) Then what was considered a gem of the first water—*Cattleya gigas Normanni*. Mr. Norman has been fortunate in getting his name identified with so superb a variety, and one, too, that is much more facile or docile in the way of flowering than this species generally is. This form, called *Normanni*, is a small grower—slender, in fact, in comparison to the many stout bulbed varieties all over the country. Check-by-jowl to this is *Cattleya Mossiae Reineckiana*, or *alba*, and a very chaste and beautiful thing it is, but exceedingly scarce. This particular form has the tepaline and petaline segments pure white, with a deep carmine blotched labellum. Nor were the plants of *C. maxima* one whit less interesting, nor the forms of *C. crispa*, which were all well represented, one called *rosea* being the elect of the lot. *Cattleya exoniensis* was also well grown, and a most distinct and in every respect desirable hybrid this, the longer it is known, proves to be. But what pleased me more than the *Cattleyas* was the batch of beautiful *Cælogynes*, most of them not long known to culturists. *C. elata* was in splendid condition, Leek-like for vigour of growth, as also were *ocellata*, *corymbosa*, and particularly *barbata*. These all seem good growers in comparison to the old but still beautiful and interesting white and cinnamon crested *conferta*. This has been long known and grown, but not always satisfactorily, and it was pleasing to see it going along well here, evidently freely served with moisture both at root and in the atmosphere. Here, too, the miffy *Epidendrum dichromum* was well in hand, and evidently prospering year by year; the amabile form of this species is a most telling one. Notwithstanding the many houses, species are pretty well mixed up, for here were *Masdevallia tovarensis*, *Odontoglossum Inseayi leopardinum*, in moss in a No. 1 pot; the really exquisite *Lælia harpophylla*, which, for its peculiar shade of vermilion and nankeen and orange, has not a single rival. Here too was the ivory *Mormodes* in its *luxatum* form, with twenty good pseudobulbs—a thing of beauty, with white wax-like segments, and lip with purple reticulated lines. Here also was another batch of *Vanda cœrulea* in fine condition, and lots of those charming Indian *Crocus* (*Pleione*), which adorn the Orchid-houses in late autumn.

#### No. 6 HOUSE.

Wending our way backwards, or rather retracing our steps, we pass into No. 6 house, at right angles. This is a capacious place, some 40 by 16 feet, and lofty, so as to give hanging room for *Dendrobes*; in truth, properly speaking, it is a *Dendrobium*-house, but made use of for lots of other species, as will be noticed as we proceed. It has the usual central table or bed, and two side stages. Chief among the plants were quantities of *Dendrobium lituiflorum*, and the very rare white variety, which is only discoloured in having two lemon lobes in the labellum. Then a sample of *D. Brymerianum*, scarce and desirable to have; the blackish-bulbed *D. thyrsoflorum*, of the same type as is now called *Walkerianum formosum*, and the short fat-bulbed *formosum giganteum*, which yields flowers of much larger and finer quality than most of the long linear forms of this species; also masses of *luteolum* and *albo-sanguineum*, which cannot bear to be over-potted; the very handsome *Cambridgeanum*, in several good varieties, at the time profusely flowered, and many others. Associated with these was a grand group of *Cattleya Dowiana*, hung up so high that Mr. Spyers had recourse to a "cleek," or hook with a handle as long as a hay-fork, to bring them down to the level of the eye. This sort of airy position seems to be the sort of climate suitable for *Dowiana*. In times past the difficulty has been to restrain the species from making two growths a-year. So surely as it does this, so surely does its day of decay and dissolution approach. When growers can keep it to the making and maturing of one growth a

season there is some chance of their being able to cultivate it, and here we saw several well-grown plants that had flowered, or were approaching the inflorescence period. The distinct airy-looking, insect-like-flowered *Oncidium phymatochilum* was doing tolerably well, and so were most of the *Catasetums* and *Mormodes* that were located here. The curious *Acanthophippium sylhetense* was very noticeable, and so was the fine buff and yellow *Thunia Marshallii*. *Cypripediums* were in great vigour, not even excepting the handsome *nævium*; *Sedeni* was the best example I ever saw. *Argus*, *Lawrencianum*, and the beautiful *selligerum*, with pale reticulated dorsal tepaline segment, and with telling pointed moustache-like petals, and a very good pouch or slipper, although not so distinguished as its other parts—two flowers to a peduncle; the rare *C. Spicerianum*, *Swanianum*, *Dayanum*, and all the forms of *caudatum*, &c. Here, too, was *Vanda cristata*, doing well, and close by it *Cattleya Eldorado*, so strong as to be emitting two leaves from one or more of its pseudobulbs. Among the miscellaneous plants not always met with were *Stenia fimbriata* and *Scuticaria Hadwenii*, with its flowers like a giant *Miltonia candida Jenischiana* springing from the base of long whip-like pseudobulbs.

two great dull red eyes being in flower. It is an exceedingly handsome Orchid, even the worst forms of it, and will vie with any cognate species for detail and beauty. *Angræcum citratum* is a miniature beauty—fine here, but nothing to what I saw it at the Messrs. Veitch's, where an artist was portraying its profuse inflorescence to some purpose. The scarcely-to-be-seen *Oncidium Lanceanum* was doing well, although there were not large masses of it. The very rare and very curious, and with a beautiful *Zygopetalum rostratum* was doing excellently for its size; but where, pray where is a specimen plant of the rhizomed species to be found? *Angræcum Ellisii* was going along satisfactorily. The equally rare *Aerides Ellisii* was present in first-rate condition. This introduction from Cochin China has flowers not unlike *Larpenæ (faleatum)*, but they are more gaudy, there being more of the nankeen colour about them; its growth is not all like *Larpenæ* however. Along with these were *virens Dayanum*, still one of the very finest East Indian Orchids in cultivation, but not a bit too good for the gentleman whose name it bears, and who has so long been an admirer and cultivator of this favourite race of plants. Then *Aerides purpurascens quinquevulnerum*, in fine condition, and *Vandas Cathartii*

FIG. 90.—FLOWERS OF THE EASTER BEURRÉ PEAR. (SEE P. 521.)

#### No. 7 HOUSE.

This may be said to form a corridor leading between the so-called *Dendrobium*-house and the East India-house proper. The chief plants here are *Oncidium crispum* and its allies *Gardnerianum*, *Forbesii*, *Marshallianum*. The second named is the favourite now-a-days, being sent home as *curtum*; at least several *Gardnerianums* have come out of the *curtum* batch. *Lælia alba* is here also in considerable quantity, but nothing like what I afterwards saw at Mr. Hill's, Arnot Hill, Nottingham, and which I hope yet to touch upon. What, however, was equally interesting to me, and doubtless more to be depended upon, was a charming lot of *Lælia elegans alba*, for purity and elegance the chief of the clan. The limited atmosphere, like an oblong Wardian case, seemed to be administering to the wants of the subjects resting within it, the kind of food they elected to assimilate.

#### No. 8 HOUSE.

This is the East India-house proper, having a central stage and two side ones with the same satisfactory ground-work for the furnishings that appear every step you take. Here were some finely grown samples of *Odontoglossum Roezlii*, some of the type with the

and *Hookeriana*, the former on a raft 4 feet long, doing well. Any one who sees *Dendrobium macrophyllum Huttoni* will long to get a piece of it; its segments are nearly pure white, and the labellum has a great solid blotch of that roseate purple which gives so good a contrast, particularly as, in this case, there is a broad margin of white around it. The *Saccolabiums* are, upon the whole, doing well, particularly *guttatum* and the autumn-flowering *Blumei*, along with good pieces seen now almost everywhere of *giganteum*. James Anderson.

(To be continued.)

THE CARPET BEETLE.—The larva of this, according to the *American Entomologist*, bids fair to be more injurious to carpets and woollen goods generally than the old and familiar clothes moth. The beetle feeds upon *Spiræa*, and on the pollen of the flowers, hence these plants are recommended to be grown as traps for the insect. The beetle has been introduced from Europe. The obvious precaution of employing rugs that can easily be moved rather than fixed carpets is suggested, and the use of tallow along the cracks and joints of the flooring and of tallowed paper underneath the borders of carpets is also suggested; but what about the carpets?

## STOVE PLANTS FOR WINTER AND SPRING DECORATION.

(Continued from p. 468.)

*Bouvardias*, of which there are now many very beautiful varieties of various shades of colour, ranging from pure white up to bright pink or scarlet, are among the choicest of winter-flowering plants. At this season they are almost indispensable for bouquets, so neat and effective are they for that kind of work. At one time they were treated as greenhouse subjects, but the temperature there being insufficient they were never seen in anything like the perfection they now attain to in the hands of those who grow them largely for market, and thoroughly understand the treatment they require. The way they are managed is to put in fresh young cuttings annually as early as they can be got, and when struck and the weather warm enough to admit of their being placed in frames, they are planted out in leaf-soil or refuse peat, or a mixture of the two and loam, so that they

that they may either be trained close under the roof or on a light back wall, as then they grow with much more freedom, and flower in the greatest profusion. Even after being cut they break again just below, as they will sometimes do in pots when the plants are vigorous and the wood well ripened. To get them into that desirable state, the plants should be fully exposed to the sun, and in the autumn only receive just sufficient water to keep them from flagging. Many complain of being unable to strike cuttings of this *Euphorbia*, but if they were to take them off before they attain a greater length than 3 inches and sever a piece of the old wood with them, they would find no difficulty in the matter. Taken off without this they invariably turn black and decay, and one cause of their doing so sometimes is that they are too soft and sappy from insufficient exposure. A cutting to be in a good state for rooting should be short-jointed and firm, and not drawn, through being shaded, or from the plants standing too far away from the glass. The best way to treat the cuttings is to insert them in sharp sandy soil in well

lost in sowing the seed, which requires a good brisk heat to get it to germinate. As soon as they are up and of proper size to handle they should be potted singly and pushed on in a moist warm atmosphere till large enough to take their final shift in 6 or 8-inch pots. Like the *Rivina humilis*, these *Chilias* look much the best grown in the form of standards, as then their bright yellow pods hang down clear of the foliage, and are more seen than they are on such as are trained bush fashion. All that is necessary is to rub out any side shoots as they show themselves till the plants reach the desired height, when by nipping out the tops they will at once branch, and if these side shoots are stopped nice neat heads will be the result. In order to get them to set their fruit freely they should have plenty of air and be stood at a sufficient distance apart in a frame to let in the sun around them, which will not only cause them to become better furnished with pods, but will keep them close and compact. An easy way of managing these, and one which saves some amount of labour in watering, is to plant them out in any pit or frame that has been used for Potatoes or other similar purposes, and then take them up for potting in the autumn, in which way they are but very little trouble, and as they never become sufficiently dry to cast any of their flowers as they sometimes do in pots, they are sure to bear a full crop of fruit. Red-spider and greenfly are their great enemies, either of which, if allowed to effect a footing, will soon cripple them beyond hope of recovery. Free syringing will keep the former down, and a few whiffs of tobacco smoke will settle accounts with the latter, but to render this effectual a still night should be chosen, and the dose followed up by administering a second the next morning.

*Plumbago rosea*, is a charmingly beautiful plant that bears numerous racemes of delicate rosy-pink flowers about the size of a sixpence, which have a pleasing effect arching over above the snowy white cloth of a dinner-table, or depending from the sides of a tall vase when used in a cut state. In habit it is so floriferous that even the tiniest plants produce bloom, and by growing them in 4 or 6 inch pots, quite neat little specimens may be had, that will come in admirably for general purposes. Unfortunately the petals are rather thin, and to improve the texture of these and render the flowers more lasting, they should be allowed to expand in a cool house where they do not get a higher temperature than about 60°, and stood so as to be close up to the glass that they may have the benefit of all the light and sun we get during the short days of winter. The way to treat *Plumbago rosea* is, when they have done flowering, to slightly rest them by keeping them a little dry at the roots, and then shorten them well back, when, as soon as they break again they should be shaken out and repotted in fresh soil and kept a little close to give them a start. Cuttings made of the young growth put in now will soon strike, and form nice little plants by the autumn. J. S.

(To be continued.)

FIG. 91.—FLOWERS OF THE BEURRÉ D'AMANLIS PEAR.

may have something rich and open to feed on. In this, with the lights closed over them early after being sprinkled, they grow rapidly and make nice bushy little stuff for lifting and potting in the autumn, which is done early, that they may have time to get a little established before very cold weather sets in. By affording them light airy positions in the stove, such as a shelf near the glass, they commence flowering at once, and go on giving a constant succession till quite late in the spring. The plants should then be shortened back for the double purpose of getting them to break lower down and affording cuttings, when they may be shaken out and planted in the same way as those that are fresh propagated. The best sorts are *Vreelandi*, *elegans*, *Hogarth*, *Humboldtii*, *Davisoni* and *Van Houttei*.

*Euphorbia jacquiniiflora*.—This is likewise one of the most serviceable plants that can be grown, affording as it does a great quantity of bloom for cutting, and although the individual flowers are small, what they lack in size they make up in brilliancy of colour. When not required for moving from place to place they should be planted out in such a position

drained pots, and then to cover with a bell-glass and stand them on any shady back shelf near the light in a stove. If they show any symptoms of flagging all that is needed to revive them is just to damp them by the gentlest syringing possible, and then to replace the bell over them at once. When struck they may be grown in any pit or frame during the summer, but should not be shaded, or they soon get to a great length, and never flower so well as they would otherwise do. Potted in 6-inch pots and stopped once or twice they form charming little plants for table decoration or for helping to fill stands in window recesses in warm rooms, but owing to its tender nature they will not do in a temperature lower than 55°, and are therefore not of much use or safe in a greenhouse where the *Sericographis* will stand.

*Chilias* Prince and Princess of Wales, from the highly ornamental pods they bear, are strikingly effective and most valuable for dinner-table decoration or using in a warm house, where, in a light situation and with a temperature above 50°, they will last in fine condition nearly the whole of the winter. To get the plants of a fair useful size no time should be

## PEAR BLOSSOMS.

SINCE we last wrote on this subject, considerable advance has taken place in the neighbourhood of London, and, on the whole, there is more bloom than we anticipated. The two illustrations we give, supplementary to those which have already appeared, are *Easter Beurré* (fig. 90) and *Beurré d'Amanlis* (fig. 91). The two furnish good examples of extreme forms. In the *Easter Beurré*, as grown at Chiswick, the leaves are oblong-obtuse at both ends, and with a minute point (not shown in the figure), and which in fact dries up and withers. The leaves are glabrous on both surfaces, but have a few hairs along the entire edges and at the tip; the leaf-stalk is very slender, and half the length of the blade. The flowers are about 1 inch in diameter. The flower-stalks are glabrous, about half the length of the leaves, and terminate above in a wedge-shaped flower-tube covered with hair, and which is the future Pear. The sepals spread widely, are of a triangular form, prolonged into a long point, and covered with reddish hairs on the inner surface. The petals are small in comparison to those of other sorts, oblong-obtuse, wedge-shaped at the base, where they taper to a short stalk. They are often irregular in form and size. The stamens are about half the length of the petals, the style separate to the base, and slightly hairy.

*Beurré d'Amanlis* offers a great contrast to the preceding. Its leaves are much longer, the slender stalk nearly as long as the blade, which latter is oblong, or, in some cases, oblong-lanceolate and acuminate, tapering at the base, and saw-toothed at the margin (though not so shown in the figure). The flower-stalks are half the length of the leaf and slightly downy. The flowers are 1½ inch in diameter, the flower-tube (or future Pear) is vase-shaped, contracted at the neck, and expanding above into a shallow-spreading cup from which the sepals spread. These latter are triangular acuminate, covered on the inner surface with whitish hairs. The petals are

nearly three times the length of the sepals, large, ovate, or roundish, very clear white. The stamens are less than half the length of the petals; the styles separate to the base and free from hairs. The flowers of this Pear are very distinct, and so handsome that, irrespective of the fruit, the tree might be grown for its ornamental character.

## GRAPE GROWING AT EASTNOR CASTLE.

It is no unusual thing to meet people conversant with gardening matters who assert that fruits of all kinds, especially Grapes, are not grown any better now than they were a generation back, whilst others as stoutly maintain that the opposite is correct, and that better Grapes have been grown and shown within the last score of years than ever were seen before. Leaving the disputants to settle their difference as best they may, there can be little question that in Grape culture, as with most other fruits, there has been a very decided advance, inasmuch as in times past there were only a few growers to be met with here and there throughout the country who could produce them with that complete finish which marks the difference between good fruit in the ordinary sense of the term, and such as possess the highest excellence, whilst there are now many who can manage them in a way that leaves little or no room for improvement.

Yet it often happens that Vines for a time, whilst just in a certain stage, produce Grapes of the first excellence, and in a few years fall off, so as to much reduce the character of the fruit, and this whilst the management is in the same hands; but this has evidently not been the case at Eastnor, nor from appearance is it likely to occur. I had an opportunity of seeing the Vines here the last week in March, and a few notes respecting them may be interesting.

Beginning with the earliest house, originally furnished in the usual way with a number of Vines, which are now reduced to one Black Hamburgh, it has been forced by Mr. Coleman for twenty years so as to come in during the latter part of May, and I understand had been similarly forced for fifteen years before Mr. Coleman's coming to the place. The berries were taking their second swelling; the crop is a full one, not so many bunches as are frequently seen on old Vines, but with an absence of the small ones so usual after long forcing. Many of the bunches will run from 2 lb. to 3 lb.

There is a peculiarity in the way this Vine has been and is being treated that deserves notice. Like the rest of the Vines here it is planted inside the front wall with a portion of roots in the inside, and the rest in the outside border. It stands somewhat nearer one end of the house than the other, and a branch has been taken each way all along the front about 2 feet above the border, from which rods at intervals are taken up the roof in the ordinary manner. Twelve years ago a young Vine was planted immediately beneath the longest of the two of these principal branches, about midway from where it joins the main stem and its extremity; the young Vine so planted, as will be seen, necessarily crossed this horizontal branch of the old Vine, which was notched across, and the young cane fitted into the hollow prepared for it. The two were bound together, crossing, as they did, at right angles, and during the season became firmly united, after which the head of the young Vine was removed just above the point of union, consequently all the power of its roots was directed to assisting the branch of the old Vine, to which it was thus inarched crossways. The stem of the young Vine, only some 2 feet in length from the collar to where it joins the branch of the old one, is now as thick as a man's wrist, and the influence in helping to support the old Vine is unmistakably apparent by the greater vigour at that end of the house. So convinced is Mr. Coleman of this that last autumn, before starting the house, he planted three more young ones, like the first, just below the two main branches of the old Vine, and joined them to it in the way described: they are now united, and will doubtless impart new vigour to the old head.

Another house, adjoining the one above-mentioned, is started at the same time, but the temperature is kept lower, so that the crop is ripe three weeks later. Here, again, one Vine—Frankenthal—occupies most of the space, but on it have been grafted the White and Grizzly Frontignans and Foster's Seedling. At one end, not covered by the old Vine, the space is

filled up with some Muscats in pots, plunged in the border. The crop collectively is most promising: some of the Muscat bunches on the pot Vines were over a foot long. The third in succession is a high-span-roofed house filled with Hamburghs alone, each Vine having several rods, the whole models of healthy vigour. They were just coming into bloom.

The next to follow is a small house two years planted, with seven Muscats of Alexandria occupying the middle, and a single Gros Colmar at one end, and one Madresfield Court at the opposite end of the house. Mr. Coleman is a firm believer in the extension system, and follows it up, and in pursuance of this all the Muscats but one are ultimately to be removed, retaining it and the two others before named, which will be encouraged to occupy the entire space. They are all very strong for their age, and showing abundance of fruit.

Then comes the big span-roofed house devoted to the old Black Hamburgh, now so well known, not alone to those who have seen it, but in a secondary way by very many more who frequently have looked upon the marvellously finished bunches produced by it, and so often exhibited by Mr. Coleman. In general condition it is in no way different from what it has been for some years; the young shoots were about a foot long, as stout and full of vigour as it is possible for them to be, mostly showing fruit from three or four joints—a circumstance that shows the thorough ripening of the wood which was effected last autumn, the sunless wet weather notwithstanding. But let it not be understood that this was secured with the later portion of the Vines here without extra means to supply that which, last summer, solar heat left deficient. Mr. Coleman says he burnt fifty pounds' worth of fuel extra last year for his Vines alone, and it is pretty certain that the money has been well spent, for it is needless to say that where Vines are in vigorous condition the wood takes more ripening than when weaker; and there is little doubt that where additional fire-heat was not used to late Vines last autumn, a good many tendrils will show where there should have been bunches. This Vine is planted inside at a short distance from one end of the house, the roots fill a good deal of space outside as well as inside; the inside portion of the border occupies the full width of the house, extending inwards for a considerable distance. Last autumn about 12 feet of the inner portion was removed and the roots cut back, with fresh soil added for them to run into. In fact, this partial removal and renewal is yearly going on at Eastnor, and is the key to the continual production, without any falling off, of perfectly finished Grapes, especially Black Hamburghs, combined of course with general skilful treatment.

Another house, principally filled with Muscats and a few Madresfield Court and Black Morocco, was nearly as far advanced as the big Vine, and, like it, was everything that could be wished for in condition. The latest house, all Lady Downe's except one or two Muscats and Gros Colmar, was just started, the bunches appearing in quantity from the shoots, which were no more than fairly broken. In the Grape-room there was still a lot of beautiful bunches, the remains of last year's crop from this house, the berries of the Lady Downe's plump and large enough to be taken for Gros Colmar. Mr. Coleman fully realises the almost unlimited quantity of water which strong, healthy Vines require when in full growth, and supplies them without stint accordingly, but he is equally careful to guard the outside roots from chilling autumn rains, to keep out which, as well as to keep in the warmth absorbed by the soil through the summer, the outside borders of all the houses forced have a good covering of Fern laid on them early enough in the autumn before heavy rains come on; over this is put shutters or oil-sheets to throw off the wet completely, and this covering remains until so far in the spring that the roots want water. *T. Baines.*

## ANNUALS FOR POT CULTURE.

At a recent meeting of the Ealing and District Gardeners' Society a very interesting paper on annuals as pot plants was read by Mr. J. Roberts, The Gardens, Gunnersbury Park, Acton. Starting with the assertion that it was his purpose to treat of a few really good kinds of annuals that are not so generally grown as they deserve to be—leaving out of consideration such commonly grown subjects as Celosias, Balsams, Mignonette, Globe Amaranthus, &c., the merits and culture of these being generally understood—Mr. Roberts went on to notice a very general opinion held by gardeners that the flowering period of annuals is of short duration, and this has operated to deter many from cultivating them in pots. This is true of some annuals when grown outside and allowed to suffer from drought and overcrowding, but they are very

different when grown in pots and kept well nourished with liquid manure. The blue Cornflower, *Centaurea Cyanus*, yields an immense quantity of flowers for several months from the same plants when liberally treated in pots.

Asters were specially recommended for conservatory decoration when well grown in pots: Reid's quilled Aster was one of the best for this purpose. The seeds should be sown in 32-sized pots in rich loamy soil about the middle of May, and the pots placed in a cold frame till the seedlings become strong, when they should be exposed to full sun and air by plunging the pots in a bed of cocoa-fibre in the open air. The plants should be thinned out to the strongest in the centre of the pot, care taken that it never suffers from drought, and by the middle of September it will develop into a fine plant, bearing from eight to twelve flowers, which will form a succession to those sown earlier in the season. *Browallia elata cœrulea* and *cœrulea grandiflora* are very useful for pot culture, and are highly effective at all seasons of the year. By making successional sowings they may be had in flower all the year round. A sowing made about the middle of February in a little warmth will make nice blooming plants during May and June, and will assist in giving variety at a season when there is not much in bloom except Pelargoniums. Another sowing should be made about the middle or end of June in a cold frame. The plants thus raised, if grown on without check, will prove very valuable for cutting purposes during the autumn months, and will last a considerable time in bloom, giving a hue of colour very scarce at that time of the year.

The different varieties of Candytufts—white, purple, crimson and flesh-coloured—are all useful in the autumn. The same treatment will suffice for these as for the *Browallias*, with the exception that more liberal drainage must be given, otherwise the plants are apt to damp off during the dull days of autumn. *Centaurea Cyanus* is, without exception, one of the best and most useful plants that can be grown in pots. The colour of the flowers is of a very attractive shade of blue, and gives a finish to a bouquet or a buttonhole plant to no other subject. It is a very free-growing plant, and if successional sowings are made will furnish flowers all the year through. This annual requires very rich light soil, the plants in 32-sized pots, three or four in a pot. A large batch of these plants should be raised about the middle of June, and another at the end of July. The plants should be grown outside during the summer months, taking them under cover about the middle of September, when the earliest sown batch will be coming finely into flower, and the late sown batch will succeed it, and yield blue flowers throughout the winter months. It is necessary during winter to give the plants a warmer temperature than that of an ordinary greenhouse. *Linum grandiflorum* is another distinct annual, and a very useful one in pots through the autumn. The seeds should be soaked a day or so before being sown, but in every other respect the same treatment as for the *Browallias* is suitable.

There are several varieties of dwarf Lupins that make good pot plants, and are very fine and useful for late summer decoration. Two of the best are *Lupinus nanus* and *nanus albus*. Another most useful plant is *Martynia fragrans*, indeed it is one of the finest annuals grown: in addition to being beautiful in colour it is very sweet-scented, and therefore a fine subject for the conservatory in autumn. It is a Mexican plant, and requires warm treatment all through the growing season. The seed should be sown early in spring in a brisk heat; the soil must not be allowed to become dry during the period of germination, otherwise the cotyledons are apt to dry up after the outer shell has burst. A close, warm frame suits this plant through the summer months, with full exposure to the sun; the foliage should not be wetted with the syringe, and at all seasons water must be carefully given. Liberal drainage is necessary, and the soil must be light, rich, and sandy. The plants will require pinching several times through the growing season to keep them dwarf and bushy; and they need shifting into fresh soil once a month or six weeks. Useful sized plants of the *Martynia* can be grown in 24-sized pots. *Nigella damascena* is another annual that merits attention, and is striking and effective in pots. The same treatment as for the Candytufts will suit it. Some of the best varieties of *Phlox Drummondii* do finely in pots. It is very useful for decorative purposes. *Rhodanthe atrosanguinea* and *R. maculata*, as well as the white variety,

possess every good point as annuals for pots; they are dwarf in habit and profuse bloomers, rich in colour and chaste in form. Seed can be sown every month in the year, with the certainty that the plants will bloom. Rhodanthes make valuable decorative plants when grown in 48-sized pots, but if grown for cutting from will do best in 32-sized pots. A light rich soil, with good drainage, suits them: about six plants should occupy a 48-sized pot, and eight plants a 32-pot. A large batch should be sown about the middle of January, which will prove valuable during the early summer months. The dwarf varieties of the Sweet Scabious are useful subjects for pot culture. These plants possess an excellent habit of growth combined with great floriferousness. The colours of some of the varieties are very striking, and quite distinct from those of other annuals. They are most useful as autumn-flowering plants, and as they are somewhat slow of growth the seed should be sown earlier in the season than some others. The end of April is a good time to sow, and the best sized pots 24's. The seedling pots should be plunged outside during the summer months, always taking care the plants do not suffer for want of moisture.

There are some fine annuals which are very useful as spring bloomers when sown during the months of August and September, viz., *Schizanthus retusus*, Intermediate Stocks, *Nemophila insignis*, which makes one of the prettiest of basket plants when grown through the winter under glass; and others. Any one requiring a really fine basket plant will find it in *Venidium calendulaceum*, a very fine annual, and one too little known. It should be sown in the spring, and planted in a large basket early in the summer, and its pendent shoots will produce a great quantity of blossoms in autumn.

As a general rule the best soil for annuals in pots is a rich vegetable mould; about equal parts of good loam and leaf-soil will suit the greater part of them. It is necessary to be very watchful in the matter of water; if the plants are allowed to become very dry when young they become stunted in growth, and rarely ever become of much service.

## AUTUMN STRAWBERRIES.

AMONGST the many legacies bequeathed to gardeners through the sunless summer of last year, none are more conspicuous than the manifest scarcity of fruit that must succeed the existing poverty of blossom, which, estimated at its best, will fall far short of anything we have been accustomed to look forward to for years. Whatever may be said or written of a few trees here or there of some particular variety bearing a crop, it is an acknowledged fact that the average consumption of hardy fruit within the shores of these islands annually is so great that we are indebted to our friends upon the other side of the Atlantic for our main supply. What, then, are we to expect during the coming season?

The tons of foreign fruits that are imported into this country annually are chiefly consumed by persons who are wealthy enough to afford a dessert, but who choose to live without the luxury of a large garden.

The traditional history of many old-established gardens, which through all vicissitudes and fickleness of climate have hitherto yielded a supply equal to private demands, are likely under present circumstances to undergo a change this year, inasmuch as the supply of fruit will not be by many degrees adequate to the most modest demands—a consummation alike disappointing to all connected with horticulture.

In the face of this important crisis in horticultural history a question naturally arises as to the adoption of some scheme that would lessen the blank in the supply of hardy fruit, and establish a practice which well deserves the fullest consideration of horticulturists. I refer in this case to the cultivation of the Strawberry during the autumn months, the production of a crop of which costs considerably less than crops of no greater usefulness that are obtained from forced plants from the month of February until the end of June. There is not a garden, whether large or small, where a few hundred plants are forced in the spring, whose owner may not enjoy a dish of ripe Strawberries from the open garden as late as the end of September; and how much more advantageous, and how much more satisfactory could the system be made by those who are possessed of better

facilities, such as pits and frames, and heated glass-houses. If people were only educated to look for Strawberries in the autumn as they do in the spring, the system would soon become general; and I suppose it is not too much to affirm that a dish of ripe Strawberries will rank equal with a dish of any other hardy fruit as late as the end of November.

There is this much to be said upon the subject at the beginning—to accomplish the work properly it wants management. By this I do not mean particular skill, but merely keen, steady application, which, with perseverance and practice, will in time make the details of the work as well known as the commonest garden operation.

The first advice that I would commend to the notice of those who are disposed to give the system more than a lukewarm trial, would be to select proper sorts for the purpose, and not to confine experiments to one or two varieties.

I find that soil and climate have a marvellous effect upon the producing power of Strawberries, and that a variety which is the wonder of one neighbourhood may be a comparative failure in another. These and other local circumstances are learned by experience only, in the same way that by personal observation of the conduct of certain kinds, planted in different situations, something like reliable data may be obtained with regard to securing a crop, or a succession of crops, with as much certainty as we look for a succession of Peas, or anything else in season. It is not the intrinsic value of a crop that is always estimated in private gardens, but the satisfaction of having things at the exact time they are required.

To market growers a new field of resource would be opened up which could not fail to be remunerative, as by planting forced plants out earlier in the season there would be the prospect of gathering three crops in rapid succession, instead of two, as is the case under the present system. There may be something to be said about a market for them at that time of year; but as most articles now-a-days are disposed of according to the supply in the market, and as large quantities would not be forthcoming for some time, it is only fair to assume that good prices would be realised in those densely populated towns where green Almeida Grapes are readily purchased. A good supply in the market would soon wean people from regarding autumn Strawberries as a novelty; and, once their worth became recognised, their popularity amongst the middle and upper classes would be sure to increase.

One other point deserves special notice: the waste of the many forced plants that go to swell the rubbish heap in private establishments; these ought, I think, to become a recognised marketable article as between the grower and nurseryman. They are infinitely superior to young plants, and would be a profitable investment for that large class who have not as yet discovered the short way to success in many branches of horticulture. How many hundreds of owners of small gardens would be delighted to have the opportunity of purchasing plants at an increased cost that would yield two crops within twelve months, instead of one in two years, as is the case where runners are purchased and planted in the spring. And yet gardeners throw their surplus stock away, and nurserymen take no notice, and the small cultivator waits patiently for two or three years for a full crop of fruit, in sublime ignorance of the fact that a return equally good is obtainable in half the time by adopting a different system.

There is no more favourable time of year for commencing to lay a foundation upon the principle above suggested than the present month. Wherever the Strawberry is forced at all, the work is being prosecuted at the present time, and plans may now be conceived upon any scale (and the larger the better, where there is room) of planting from fifty to as many hundred plants. The occupier of a small garden will not be particular whether he finds himself the possessor of a crop of Strawberries in the middle of August or at the end of it; so that really in their case all that is necessary is to make a plantation at once according to instructions which shall be detailed presently, and leave the rest to the weather.

The position is altered with respect to practical gardeners, of whom different things are expected. In their case, then, the most certain way of proceeding to work with a view of having a succession of ripe fruit in the open garden during the autumn, would be to take ordinary care of plants as they are turned out of the forcing-houses by giving them the protection of

a cold pit or frame for a few days, until the tissues of the leaves grow firm enough to stand the exposure of the weather. While the plants are undergoing this preparatory process, a suitable situation should be chosen for planting them. Preference would, of course, be given at any time to a south aspect, but any open quarter will suit them perfectly; indeed, an open plot in the garden is far superior to a sheltered one after the beginning of September, because the conditions afforded are more favourable for the plants to set their fruit, as the days grow short, and heavy dews hang about a long time in places where there is not a sweeping current of air or direct sunshine to absorb the moisture.

I used to plant them on a raised mound, where the soil was light and open, and the fruit never failed to set perfectly in every respect until the middle of October. In order to secure a regular succession of fruit, a batch of plants should be planted out every fortnight from the end of April until the beginning of June, and this would give full scope for lifting a stock for fruiting in pots as well. Before planting is commenced the ground should be in good working order, and the balls of the plants should be in a mellow state; in fact, both bodies of earth should be in an equable condition, otherwise planting cannot be performed efficiently. A safe way of going to work is to soak the balls of the plants with water, and protect them if the weather is showery until the ball will handle without being sticky. Then divest the plants of all decaying appendages, and loose the roots round the outside of the ball if they are hard and wrapped together, and proceed with planting at from 15 inches to 2 feet apart each way, according to the habit of the variety. The main point to be kept in view in planting out these plants is to see that the earth is pressed as firmly about the balls as the earth of the balls themselves, otherwise the roots will not take in a proper supply of water, and healthy progress will be rendered impossible.

I see no reason why cold pits and frames, which accommodate bedding plants in the spring, should not be used for fruiting Strawberries in the autumn. The protection from excessive rains, and other advantages to be secured in the declining autumn, are too clear to require special allusion except by way of reminder. A couple of hundred plants lifted from the end of September to the middle or end of October, and potted up carefully, would continue the supply to Christmas.

Where it is chosen to keep the plants for this purpose in pots, they should be kept behind a north wall for a couple of months, and then overhauled either by fresh potting or top-dressing where it is not convenient to shift them into larger sized pots. They will come into flower by the beginning of autumn, and there is no difficulty in working them along quietly to succeed those in the open garden. Relying upon the advice it was my privilege to give from time to time in the pages of the *Gardeners' Chronicle* upon this subject, I am presuming only upon reviving an interest in the present state of affairs in the cultivation of the Strawberry in autumn, from experience already detailed in your columns. *Wm. Hinds, Canford Manor, Dorset.*

## AN AMATEUR GARDENER'S EXPERIENCES.—I.

IT was my fortunate lot, though town-born and bred, to have as a boy friends and relatives in pleasant country places, and thus it happened that most of my longer schoolboy holidays were spent among rural sights and scenes. Attached to some of the houses I then visited were pleasant gardens, and one of my friends was an enthusiastic and successful gardener. I suppose I must have had a natural taste for gardening, for even as a very small child, while attending a dame's school, some of my pleasantest pastime was found in tending, in child-fashion, a tiny little garden—a very tiny one. It was in a sunny corner, though not in the most salubrious atmosphere, for my home was on the edge of a big smoky manufacturing town. I well remember my first transaction with a seedsman. One fine Saturday early in spring, I was out with a schoolfellow for a walk down the main road close to my home which led countrywards, and was the possessor of a penny, which at the age of six was a sum to think about. My companion was a juvenile gardener like myself, and was equally occupied on holidays in investigating

the progress of the Daisies and other simple plants we were able to get possession of. We were constantly lifting our plants to see how they were growing, for the notion possessed us, as it does most children, that growth was to be measured by the condition of the roots. On our way we passed the shop of the local seedsman, who was also the local corndealer. The arrival of the seed season he indicated by placing in his window a wooden tray separated into a number of small divisions, each of which was filled by packets of some one kind of flower seeds, each duly labelled with, to us juveniles, some mysterious name. The happy conjunction of a penny in my pocket, the alluring presence of the packets of flower seeds, and my interest in gardening, caused me to look at the contents of the wooden tray with marked purpose. I was not long in making up my mind. Among the tempting seeds offered for sale I found some labelled Love-lies-bleeding, and the name was so attractive that I boldly entered the shop and bought a packet. I am afraid I sowed the seeds too deeply, for though I watched for their growth with the most assiduous care, and made my little garden absolutely muddy with the supply of water I poured on it, my investment yielded no results except the occupation it gave me, and it was years after before I had the pleasure of seeing Love-lies-bleeding in flower.

choicest of fruit. There, too, were such numbers of Moss Roses and hardy herbaceous plants as I had never seen before, and I went home laden with lovely flowers. That garden was a real "pleasance" to me, and I always recur to it when I think of delightful gardens I have visited. Then came visits at least twice a year to an old relative residing in a delightful country town, where I made closer acquaintance with the occupants of a well-cultured garden. A year or two afterwards I made a visit to some friends of my family, old-fashioned farmers, whose homestead stood half-way up a hill-side overlooking the valley of the Teme. Never shall I forget that journey. I travelled some thirty miles by rail and then a dozen more by coach. It was May, a genial May: the rich pasture lands glorious in their brightest array; the multitudinous orchards one blaze of flowers, the perfume of Hawthorn bushes everywhere. It was my first visit to the rich orchard country of Worcestershire, and the remembrance of the delight it gave me is as vivid as though it had happened but yesterday.

The farmhouse was an old-fashioned, long, irregular building, facing south. It was covered with climbing Roses, Honeysuckle, some gigantic Fuchsias, and a Brown Beurré Pear tree. In front, gently sloping down from the house, was a lawn bordered at each end with glorious shrubs, and below it and at one end was a large well-managed kitchen garden. A few flower-

## Foreign Correspondence.

FRUIT GROWING AT THE CAPE.—Of native fruits little need be said—useful and luscious fruits are the products of civilisation. The early emigrants took the matured trees and shrubs to the colonies with them. In about 18,000 varieties of plants in Cape Colony there are few of them agreeable to European palates. The primitive Dutch settlers were great in horticulture; but it was to the French Huguenots, flying from persecution in their own country after the revocation of the Edict of Nantes in 1685, that the Cape is most indebted for the glorious Vine.

Some of the indigenous Cape fruits got European appellations, without much resemblance in flavour to those after which they were called. In this way we read of native Plums, native Oranges, native Apples, &c. The Natal Orange runs into Cape Colony. The rind is hard, the stones are poisonous, but the pulp has a sweet acid, which is welcomed by elephants and men; its odour is attractive. The Kaffir Plum and the wild Plum are not distasteful. There are stone fruits no larger than Peas, and a number of medicinal fruits. The wild Almond is deadly when fresh, but good after soaking in water. There are wild Chestnuts, Figs, Apricots, Melons, and Apples. The Kei Apple of the East is not an Apple, though

FIG. 92.—CHINESE FLOWER POT. (SEE P. 523.)

Time passed on, my home was removed into the centre of the town, and my opportunities for gardening were limited to occasional visits to a schoolfellow who, fortunately for both of us, had a bright little plot in which, with the aid of his father, there were always to be seen in spring and summer some of the commonest hardy plants which seem as though they had been given purposely to encourage attempts to grow something even in the most uncongenial situations. The father of this boy had a nice "guinea" garden (so called from the yearly rent paid for it) in the outskirts of the town, and on one memorable summer's evening I was taken to see it. It was a delightful place in my estimation, crammed with old-fashioned plants, vegetables, big fruit trees, including a magnificent Siberian Crab tree, and oh! such an appetising bed of Strawberries. Even now I can revel over it in imagination, as I did then in reality in the privilege of gathering those luscious berries. Never since have I had fruit which so entirely satisfied me. I think that visit settled in my mind a fixed determination to have a garden of my own when I had reached man's estate. If any wavering on the subject existed it must have been driven away the following year, when I was set free in another charming old-fashioned garden in the pleasantest suburb of our town, and told I might eat my fill of Gooseberries, which hung in rich profusion dead ripe on numberless trees. Next to the aforesaid Strawberries those Gooseberries stand out in my memory as the

beds cut out of the turf were gay with a profusion of bright blossoms. The flower gardening was all done by the farmer's eldest daughter, who was as enthusiastic in the pursuit of gardening as she was skilful. That was, for a farm garden, the brightest and best managed I have ever seen, and my first and subsequent visits to it deepened my interest in gardening and made me long still more for a garden of my own. Sometimes, while on a visit to these friends, I used to be taken to the admirable gardens of a neighbouring Baronet, and there I made my first acquaintance with a really skilled professional gardener—the first of a long list of men whom I am proud to regard as friends. I must confess to a great liking for good gardeners. I suppose it is the humanising nature of their occupation which makes them such pleasant companions. Speaking generally of such as I know best, I am bound to say they compare most advantageously with all classes of men of the same, and with many of higher, standing in the world. They are courteous and hospitable; they are cultured to a degree which those who do not know them intimately would never suspect; not a few of them are well read in the best literature of the country; as a body they are thoughtful and cautious, and are not prone to form hasty conclusions. Even to strangers they are readily accessible when it is known that these visitors are interested in the pursuit of their lives. Take them for all in all, they are the pleasantest lot of men I know; and I say again, I am glad to number them among my best regarded friends. *Philanthos.*

looking like a small one. It is the fruit of a small tree which bears the name of *Aberia Caffra*.

The European fruits growing at the Cape cannot be surpassed by the best growing in England, France, or Italy. Every sort flourishes well. With 7000 cases in orchard and garden good results may be expected. Dutch Boers like to have their houses surrounded by fruit trees: the old villages of the colony, therefore, have a beautiful appearance. The Paarl district, not far from Cape Town, had 687 acres in orchard during 1878; Tulbagh had 460; Oudshoorn, 449; Calvinia, 448; Stellenbosch, 367; and Cradock, 349. Among such fruits the Orange took a foremost rank.

The Vine, in spite of the spread of modern disease, still occupies a prominent place, especially in the neighbourhood of Cape Town. Last year there were 8588 acres bearing. The Paarl division was said to have 20,000,000 Vines; Stellenbosch, 15,000,000; Oudshoorn, 6,000,000; Worcester, 5,500,000; and the Cape, 3,000,000. Every visitor to Table Bay runs off to Wynberg and Constantia to taste the delicious Grapes there. Many of these are converted into raisins, equalling the best Levantine ones in flavour. Nearly 3,000,000 lb. of dried Grapes were prepared in 1878.

As to the wines, there is a very large consumption in the colony itself, at a retail price of 3s. a gallon—much too easy a rate to be withstood, by the coloured races in particular. Brandy made directly from the Grape is in extensive request also among Kafirs and

Hottentots. During 1878 there were made 4,485,665 gallons of wine and 1,067,812 gallons of brandy. The distillation goes on merrily, to the sad loss of much national virtue and wealth. At one time there was a vigorous exportation of Cape wines into Europe, but, prepared badly and unduly fortified for the voyage, they had a bad reputation. When made with care, it is said the wine there is equal to any Spain can produce. The high percentage of alcohol subjects them to an English duty of half-a-crown a gallon when 1s. is paid on French wines. The Pontac red wine of Constantia is made when the Grape is nearly shrivelled up. The Hanepoot, from the Muscat, is mostly preferred, having a great resemblance to Madeira. The Pontac loses its colour with age. A

London agent in Blomfield Street, and form at the Cape as healthy and happy a home as could be had in any colony of the empire.

CANADIAN NOTES.—We have had a very peculiar winter—not at all like our usual Canadian season. The cold and snow, which came very early, soon left us, and has only returned occasionally for a day or two, and we have had very little sleighing, but a great many delightfully warm and bright days. The lack of snow, however, has been disastrous in many instances to the fall Wheat, which were put in on at all unfavourable circumstances, has succumbed to the alternate frost and sun. The description of Wheat we have sown most of is the Seneca, which yielded us

market at about 4½ cents per pound live weight—say 24d. per pound English currency. The lumber trade is reviving nicely, and prices have considerably advanced. A new trade has sprung up in Barrie in a large demand for ice, which is cut out of the Bay and loaded on to the railway trains alongside for Chicago and several other large cities of the United States. A long train is loaded every hour. *J. M., Mining, Ontario, March 24.*

### Florists' Flowers.

SEASONABLE NOTES ON HARDY FLORISTS' FLOWERS.—AURICULAS.—There is a good deal of work to be performed in May. There are always a few

FIG. 93.—A MOUNTAIN IN A FLOWER-POT. FROM A JAPANESE DRAWING. (SEE P. 528.)

sort of hock is made from the Steen Grape, and is very strong. Most wines are prepared from the black and white Green Grape. The custom of adding spirit to the liquor alters the character of the natural wine. Cape wines are now being much improved in quality.

The newly proclaimed agricultural areas, open to selection on the system of ten annual payments of 1s. an acre, promise to be enormously productive in fruit. The rich soil, abundantly provided with running water, with the shelter of native woods, must yield plentifully. The new settlers taking up these fine farms will have delightful orchards about them in a few years, and be able to send their fruit to the English market with the same facility as Spain and Portugal did a few years ago. Any persons not farmers, but with gardening tastes, might embrace the liberal offers of the Cape Government, through their

some excellent crops last year. March has had very little cold weather, but to-day has been cold enough—perhaps 15° or 20° below zero at sunrise.

The winter has been very cold in the great North-west—Manitoba and the other provinces; it is said as low as 47° below zero. The crops of Wheat there on high ground were good, but poor on the low ground, and many are changing their farms. Many farmers are selling out from this province to go there, and a large number are anxious to dispose of their farms for the same purpose, as a prairie farm soon brings in a good return; but still every one who goes is anxious to get some bush with it.

Potatoes have kept well with us, and are selling at 45 cents a bag—say a farthing a pound your currency. The Early Rose is almost the only sort grown about here. Fat cattle are purchased for the English

late flowering varieties that continue in flower until the second week in the month, but the usual routine work for the last days of April and the beginning of May is to remove the plants as they go out of bloom from the pit or house where they have been arranged to the frames behind the north wall, or any other place where the plants may receive shade during the hottest part of the day. The plants should be repotted towards the end of May, but the matter of two or three weeks either way is immaterial. Exhibitors who remove their plants to a considerable distance for exhibition find it necessary to repot them as soon as they get them home, that is usually about the end of April. I have repotted plants at that time, and found they did quite as well as at any other. The composition of the potting material and the care with which the operation is performed is of more import-

ance than the time of the year. Use good yellow turfy loam four or five parts, rotten cow-manure one part, and one part leaf-mould; a little sand, and pounded but not powdered charcoal, may also be added. The lights should be removed from the frames except when it rains, or during very high winds.

#### CARNATIONS AND PICOTEES.

The cold cloudy weather we have had during the last ten days or more has not been conducive to the healthy development of these plants. It does seem that many of the old choice varieties have become constitutionally enfeebled through continuous propagation for a period in some cases exceeding fifty years, and in many instances a quarter of a century. We have a number of varieties recently raised from seed, and these are starting with a vigour not to be found in the older varieties. It may also be as well to remind growers that a change of stock is desirable. One grower called here last autumn, and told me that his stock of plants had so degenerated for want of change that scarcely any of them were capable of producing decent flowers. It is also a good plan to prevent certain plants from flowering, so that their whole strength may be thrown into the production of "grass." All the weak plants should be treated in this way. Mr. Simonite wrote to me quite recently to say that he would have to cut down many of his plants to save their lives. We are now turning our strongest plants out-of-doors, and placing sticks to them. It is not safe to turn them out without doing this, as many of the plants are injured by being loosened, and many of them might snap over. Keep them under glass as long as it is convenient to do so.

#### DAHLIAS.

Continue to repot these as they form roots, letting them remain in a gentle bottom-heat in a frame until they start again. Plants that are established in 5 or 6-inch pots, should be placed in cold frames not too close together. Admit plenty of air, even removing the lights altogether in fine weather; this promotes a healthy short-jointed growth. The glass lights must be covered over closely with mats at night if there is any danger of frost.

#### GLADIOLI.

We have now planted out the whole of the corms. The ground was not so dry as we like it to be, but we had some dry sand to place under and over the corms, and some dry loam to fill up the drills with. The seeds sown early in April in pots, and plunged in a hotbed, have now vegetated freely. By far the best plan is just to let the pots remain where they are, and as the plants progress in growth admit more air by day and do not shut up the frame quite close at night. The plants grow as freely as pots of grass would, and at a little distance the appearance of the frame is not unlike a patch of young Wheat. Water freely as the young plants require it.

#### HOLLYHOCKS.

The earliest plants should now be well established out-of-doors and growing freely. One stem only should be allowed to each, and that must be fastened to the sticks as they advance in growth. The very latest propagated plants should be put out without any further delay. Many persons sow seeds early in the year, but I fancy that the end of May is as good a time as any. If they are sown earlier in the year the flowers make an attempt to flower the same season; a stem is formed, and flower-buds which do not open. Plants obtained from late-sown seeds will not do this, and will flower all the stronger next season. Keep the surface of the ground well stirred with the hoe amongst plants, seedlings or named sorts.

#### PANSIES.

The instructions as to management are not very different to that given at p. 429. Follow out those instructions, also keep the ground free from weeds by hand-picking, also by stirring the surface with a Dutch hoe. The plants in pots will continue to produce flowers very freely, but manure-water must be given at each alternate watering, and air must be admitted freely. It may now be desirable to obtain a batch of young plants for late flowering; if so, there are plenty of small growths near the base of the plants. These can be pulled out with the fingers and inserted in hand-glasses in fine sandy soil.

#### POLYANTHUSES.

The border varieties, mottled and selfs, are now coming into flower, and they are very beautiful

objects for the flower borders or when planted in masses. The gold-laced section when cultivated in the same way are even more attractive. Ours out-of-doors made very strong growth last year, and each plant is now a good mass with a dozen trusses on each. The seeds were sown at this time last year, and we have now sown batches both of the border Polyanthuses and Primulas. Now is a good time to sow the seeds, if this has not been done. The show plants in pots have not grown so freely this year as they did last, nor are they quite so early. All the varieties are now in flower, and the rich colours, laced with clear pale or deep yellow, are very pleasing. *J. Douglas, Loxford.*

## Garden Operations.

### KITCHEN GARDEN.

**ARTICHOKES.**—As a rule, the cultivation of both kinds of these excellent vegetables is more restricted in extent than that of any other sort of edible —Cardoon, Salsafy, and Scorzonera excepted. This, in some measure, may be accounted for by reason of the mode of dressing and cooking them being, generally speaking, but imperfectly understood, excepting by trained hands in this art. The tuberous or Jerusalem Artichoke is undoubtedly more extensively grown in this country than the Globe kinds, which are used in a green state. The former is naturally an accommodating plant, seeing that the position it occupies at certain places is such as where scarcely any other subject will thrive; it does, however, succeed in this way in almost any soil and situation, and may not therefore inaptly be planted, if occasion requires, to screen any unsightly object which needs to be hidden during late summer and the autumn months. But for culinary purposes such places are not those from which an abundant yield of well-flavoured tubers are to be expected. For this end the plant should be placed where more sunshine and light abounds, and in soil moderately well enriched and which has been trenched deeply, and if it partakes of a sandy nature so much the better will the quality of the tubers prove to be. The planting of tubers may be effected at any time between the beginning of March and the end of April, in lines about 3 feet apart, 18 inches asunder, and 6 inches deep in the soil. Moderate-sized plants are the best for planting purposes. During the period of growth the ground about them should be kept free from weeds, &c., until the tubers are fully grown, which will be the case by the end of November, when they may be taken up and stored away, or otherwise be left in the ground and lifted as required. We prefer the latter course.

The Globe section comprises several sorts, but the best variety, in my opinion, is the Green Globe; its superiority to the others consists in the substance at the bottom of the choke and the scales—the eatable parts—being alike more fleshy and tender. The habit of this plant is naturally somewhat tender, so much so that scarcely a winter passes without its effects destroying the leaves of it entirely; but fortunately it is not so in the case of the roots. In my opinion many plants are sacrificed every year through having a superabundant quantity of material placed on the crowns as a means of protection against frost. The only covering the plants here have had during the past three seasons has been that which remained from a heavy mulching of manure applied the preceding spring, and the protection that is afforded by the leaves of the plants themselves being kept undisturbed in the autumn. The actual result of this experiment is highly satisfactory, inasmuch as our losses in the way of plants, even in this damp position, are less numerous now than they were when we covered the plants up more abundantly. The primary object in the cultivation of these plants is for the sake of the heads which they produce. This being the case, the most important consideration is how to obtain these in the best condition possible. As they are required to be young and tender and as large as possible, it is essential that the plants be grown as exuberantly as the nature of circumstances will admit. For this purpose, therefore, soil of the best quality is indispensable, which should be fully enriched, deeply trenched, and in a moist place if practicable. The plants should further have a liberal area devoted to them, to effect a proper development. In the course of practice we have found that where a demand for this edible is frequent and continuous throughout its season, the best way is to plant twice every year, at the spring and autumn, and destroy a corresponding number of plants accordingly. The former planting is made as soon as the plants have made about 6 inches growth, when we lift entirely and divide them into moderate-sized pieces, as many as are required for planting, and discard the rest. The selected roots are planted out at once in individual rows or otherwise, from 4 to 6 feet apart every way, according to

the state and condition of the land and place where they are to be located. The autumnal planting is made precisely in the same manner about the middle of September. The rampant nature of the foliage of these plants, and the mulching material which is added, does in some measure preclude the growth of many weeds about them, and thereby diminishes the ordinary attention in this way, and confines it merely to mulching once annually, watering occasionally during very dry periods—to thinning out and taking away exhausted leaves and stems, and, for the purpose of obtaining very fine heads, to removing those laterals which spring from the main stems.

General work of a routine nature at this period will comprise such operations as hoeing and stirring the surface soil about seedling crops, and to setting out and thinning them afterwards. The plan of sowing all such crops as Onions, Carrots, and others of a like nature in drills, rather than broadcast, is infinitely superior to it, and more systematic in practice, and needs no commendation further than to remark that the trifling extra labour at the outset is more than compensated by the facilities which are gained for performing subsequent operations. As soon as the rows of these subjects are plainly distinguishable lightly hoe over the ground between the lines, and cross-hoe these again in the case of crops as Beet, Parsnips, Turnips, and any other subjects which can in the first instance be set out at from 9 to 18 inches apart, and thin out the bunches by hand afterwards. Of Onions and Carrots we are accustomed to leave double the quantity required for the crop, so that every other one can be drawn in a young state for use as required. Any preparations which may be necessary beforehand for getting out the plants of Vegetable Marrow should be made now, and those for Tomatos should be seen to likewise.

**FORCING DEPARTMENT.**—The preparation of Tomato, Capsicum, Gherkin, and ridge Cucumber and Vegetable Marrow plants will demand a share of attention now; all these plants should be got into a strong condition, and be properly hardened off before the time for planting them out arrives. See also that none of these subjects are allowed to assume a stunted state for the want of more pot-room during the period, but rather shift them on into larger pots, so that they may shoot off freely when they are planted out, and make the most of the short time they have to exist out-of-doors. Other crops, as French Beans, Tomatos, Potatos, Carrots, &c., will need to be freely ventilated on sunny days, and plentifully supplied with water as occasion requires; the former subject should be pinched at about the second joint to make them bushy, and long kinds, as the Canadian Wonder, should be kept upright.

**FRAME GROUND.**—These conveniences will in many cases be occupied by plants in preparation for other places, as Celery, Brussels Sprouts, &c. Freely ventilate all these kinds of plants, and Peas, &c., likewise—those here are now blooming profusely, and promising well for subsequent results.

**MUSHROOM-HOUSE.**—This place should be kept cool and moist, and the beds be watered whenever required. This will also be applicable to beds made at other places. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**THE CHERRY-HOUSE.**—In this compartment here the Cherries are ripening rapidly, those at the most forward part of the house being already ripe enough to gather. Under these conditions the fruit itself must be kept perfectly free from moisture in any form. The ordinary dampings of the house may, however, be continued, provided air be constantly left on the house at its apex to prevent condensation taking place in a manner that will affect the fruit. Freely ventilate at all times, according to the state of external circumstances, and at such times as these are most favourable allow a constant current of air to pass through the house; at times of an opposite character, recourse should be had to other heating appliances to supplement this deficiency, and to ensure a circulation of warm and dry air. See that those formidable pests, the black flies, do not gain a footing anywhere about the trees; if so, they must be destroyed at once by dipping the affected leaves or shoots in a decoction of tobacco-water, or that made from Quassia chips. Take whatever precautions may be deemed expedient to prevent birds from attacking the Cherries at those parts which in the course of ventilation may be at times fully exposed to their depredations. Sparrows are the most daring visitors in this way. As the shoots on the trees lengthen, those which are to be retained must be tied in, and others which are not wanted should be stopped at the fifth or sixth leaf. *G. T. Miles, Wycombe Abbey.*

### PEACHES AND NECTARINES.

The trees in early houses, from which ripe fruit will be gathered about the end of May and through the month of June, will now require the final thinning of fruit and wood; and when this has been com.

pleted the young shoots which have been allowed to make unrestricted growth during the stoning period, which extends over a space of five or six weeks, should be neatly tied to the trellis as the work of elevating the points of the fruit to the influence of the sun proceeds. Where quality is preferred to quantity sound healthy trees, well furnished with active roots established in internal borders, may be allowed to carry one fruit to every square foot of trellis covered with foliage, while Nectarines may be left a little closer together; but beyond a certain point nothing is gained by leaving a great quantity, as the formation of the stones weakens the trees, and the fruit, when ripe, is small in proportion to the excess. Shoots which emanate from the bearing wood of the current year should be allowed to grow evenly all over the trees without being stopped, as they will become the fruit bearers next season, and where other growths have been left between them and the terminals they should be removed, as the former require more room for the development of their leaves. Terminals should not be stopped until they reach the extremity of the trellis; but shoots intended for removal after the fruit is gathered will increase its size by being pinched when the last swelling for ripening sets in. Carefully water the roots with ample supplies of diluted liquid at a temperature of 70° to 80°, as the great strain of the crop, in addition to the extensive breadth of foliage exposed to the sun, enables trees in properly drained borders to take large quantities; indeed, the most frequent cause of premature ripening may be traced to an insufficient supply to the roots through the last stages. When the fruit is fairly on the move for the last swelling, the temperature by day may be considerably increased, provided the trees can be allowed to rest by night, when a circulation of air will add greatly to the colour and flavour of the fruit. Syringe twice a day with clear soft water, as water containing lime disfigures the fruit; and endeavour to have the foliage quite free from red-spider when the ripening stage necessitates its discontinuance. It is of no use trying to hasten the stoning process in succession-houses, as the fruit must have time, an equable temperature, and generous treatment. Follow up disbudding until every shoot that is left will have full space for development and exposure to the solidifying influence of light and air. Disbud the trees in late houses, and thin off all small and badly placed fruit, leaving a fair percentage for choosing from when the most promising take the lead. Syringe copiously when the weather is fine, and ventilate by night and day when it is an advantage to have the fruit as late as possible. *W. Coleman, Eastnor.*

#### ORCHARD-HOUSE.

We can now tell what are our prospects of a crop, and it is very satisfactory to know that Peaches, Nectarines, Plums, and Pears are as good as usual. On some of the trees there were but few blossoms, and such will have a poor crop or none at all; but we generally have more trees in the house during the spring months than space can be spared for them during summer. As soon as the trees can be moved out-of-doors they will be placed in a position where they can be fully exposed to the sun, and partially sheltered from the north-east and south-west winds. Pears and Plums do remarkably well when the trees are in pots, and they can be moved out-of-doors into a warm position. Many varieties of Pears, when they are cultivated under such conditions, are even superior to those that can be obtained from walls, the colour of the fruit and its high class quality being remarkable. Plums are not quite so good as those grown under glass, and they are apt to be spoiled by deluges of rain in the autumn. Such fine Plums as Transparent Gage, Jefferson, and Coe's Golden Drop are well worth any space under glass that they may require. I have sometimes placed trees of the earliest ripening Peaches and Nectarines out-of-doors to ripen their fruit, but have not been very successful with them. The fruit is often small and badly coloured, besides being of poor flavour, even as compared with wall fruit. The details of the work are very simple, and may be summed up in a few words. At 6 o'clock in the morning open the top ventilators a little, and give the trees a thorough syringing with clear rain-water. About 8 o'clock more air should be admitted, unless the weather is cold. The temperature may rise to 70° in the shade, and this will do no harm. About 4 o'clock shut up the house, and syringe again if the weather is genial, but in cold, cloudy weather it is better not to syringe at all at night. The best time to water the trees is in the afternoon, before shutting up the house. Strawberry plants on the shelves also require attention now. As soon as the fruit is fairly set thin out all but nine or a dozen of the most promising on each plant. Where the orchard-house trees have been forced a little, the trees will now have made considerable growth, and the shoots must be stopped, beginning at the top of the tree. It is not always best to stop the weak growths, but it is quite necessary to stop those that would run up to 2 feet or more; if such strong growths are stopped at the fifth leaf, three or

more weaker growths will be thrown out, but no more of them need be retained than may be necessary. The fruit must also be well thinned out; this is generally of inferior quality, owing to the owner wishing to have more than the trees will actually bring to perfection. No greater mistake can be made than in over-cropping the trees. The fruit is not only under size, but it is deficient in quality; and the trees will also suffer, and fail to produce a satisfactory crop next season. *J. Douglas, Loxford.*

#### PLANT HOUSES.

ORCHIDS.—As a rule every good Orchid brought for the first time into the market has its merits rather over-lauded than under. *Maxillaria venusta grandiflora* is an exception. When this excellent Orchid was sold in the imported state for the first time, buyers of it thought that the most they would get out of it was a good variety of *M. venusta*. Had they got no more for their money they would not have done badly, for *M. venusta* itself is a good thing when well done, and the prices paid were not high. The variety, however, proves itself to be a far better thing than the species. Its flowers are quite equal in purity of colour and sweet perfume, are much better in shape, and, above all, hold themselves erect, in the way of *Lycaste Skinneri*. It is, indeed, the nearest rival to *Lycaste Skinneri alba* of any Orchid I know. This plant grows luxuriantly potted in peat and sphagnum, with its pot two-thirds full of drainage, alongside and under the same treatment as *Odontoglossum crispum*. The collector states it to be very free flowering in its native habitat, and that he has seen as many as fourteen flowers to one bulb. This may be so, as quite that number can be obtained from a bulb of *Lycaste Skinneri*; but under cultivation the *Maxillaria* up to the present time has not proved itself to be very free flowering. This may be owing to our not having properly ripened up the bulbs, and we intend next autumn to withhold, at any rate for a short period, the liberal waterings which the plant delights in when growing. Another cool Orchid which came over in large quantities about the same time is *Odontoglossum pardinum*. Great was the praise bestowed upon this plant, and a marvellous picture, said to represent the plant flowering in its native habitat, did its work well, from the seller's point of view, for many an extra bid was given on the strength of its being a correct representation. Many plants of *O. pardinum* from this sale have now flowered in various collections, and I am afraid have received far more curses than blessings. In many cases, instead of assuming the bright colours depicted, it has been as dull as *Gomezia planifolia*; especially has this been the case with plants grown within the evil influence of London smoke. Here, and also in other places where the air is clear, the plants have turned out quite up to our expectations, in colour, form, and habit of flowering. We look upon it as quite an acquisition to the cool house, and feel certain that when we have established our plants, so that they make bulbs as large as the imported ones, that *O. pardinum* will be a very showy plant. *O. pardinum* will grow perfectly well, potted in well drained peat and sphagnum, and kept under the same moist, cool, and airy conditions as *Oncidium macranthum*. The new *Odontoglossum Edwardii* should have exactly the same treatment. It is now flowering, and its violet colour and Violet scent, make it a very desirable plant. It proves to be also both a free grower and a free bloomer. Plants of *Phalenopsis amabilis grandiflora*, and *Schilleriana* will now be starting both roots and new leaves; if any require top-dressing, or new baskets or pots, let them at once be seen to ere the roots get too long. Where these plants are grown standing on side stages, woodlice are very apt at this period to crawl up and eat the tips and edges of the young leaves. A few scooped out Potatoes should be laid here and there to trap these pests; they may also be caught in the very act, during the nightly round with the lamp. The temperature of this house must now be decidedly tropical; 75° must be the lowest day temperature, with a rise by sun-heat of from 5° to 10°. The night temperature should be about 68°, a few degrees less will do no harm; but the day temperature should be strictly maintained. In the same house, *Grammatophyllum Ellisii* will be pushing its young breaks, and must now be treated generously as regards water. Avoid getting any down the young breaks, as they are easily rotted. This being a shy flowering plant it will be best to keep it rather under than over potted till it shows flower, when a careful shift would no doubt do good in giving its many large roots new feeding ground. In the *Cattleya*-house special attention must now be paid to *Laelia elegans* and its varieties. When resting these *Lælias* are as easily kept in good order as the many species of *Cattleyas*, but when growing they are certainly more easily upset by sudden falls in the temperature or by water lodging in their young breaks. They delight in an airy, moist, warm atmosphere, but should be placed as far away from the ventilators as possible. Give them a trifle more shade and water than such short-bulbed *Cattleyas* as

*C. Mossie*. This house should now have a day temperature of 70° if maintained by fire-heat, with a rise of from 5° to 10° by sun-heat. Ventilate freely whenever the external air is above 50°. With the exception of frosty nights there is now no need to use fire-heat in the cool house. On such nights turn the heat on as late as possible, and off as early as possible next morning. Ventilate freely whenever the external air is above 45°, and shade the moment the sun is carrying the inside temperature above 65°. *J. C. Spyers, Burford Lodge, Dorking.*

PLANTS IN COLD FRAMES.—Amongst other hardy plants that we are cultivating in pots are the *Fritillarias*. This is a very interesting class of plants, and they succeed well in this way. *F. Moggridgei*, with its bright yellow flowers; *F. Burnatii*, with dark, dull maroon, and the pure white variety of *F. Meleagris*, are now in flower; they are quite hardy, and the only object of having a few in pots is to be able to enjoy them when they are quite spoiled with the rain out-of-doors. The hardy *Cypripediums* are even more interesting, and nearly all of them succeed in pots. What they need is syringing overhead once or twice daily when they are making their growth. I also like to have the surface of the soil covered over with growing healthy green moss. We have now in flower *C. acaulis*, *C. Calceolus*, and *C. pubescens*. Many other species are growing freely, and will flower in their season; the growing plants must be shaded from too much sunshine. We have also *Podophyllum Emodi* flowering; it seems to succeed well with pot culture; it has been potted in peat with a little leaf-mould added, and the plants seem to thrive well in the same frame with *Auriculas*. The species of hardy *Primulas* have now very nearly all gone out of bloom; they have been removed to a partially shaded place. The plants have been placed in hand-glasses, but the lights are removed in the same way as those over the *Auriculas*. We do not like these *Primulas* being exposed to dashing rains. *J. Douglas, Loxford, Ilford.*

#### TOWN GARDENING.

LAWNS AND WALKS.—Lawns will require constant attention now. They should be well rolled with a heavy roller twice a week, and the slopes, which are often neglected, should be especially attended to. It is our practice before we commence with the machine to skim over the lawn with the scythe to take off the rough bents; I have tried several times to do without the scythe, but with unsatisfactory results. Walks should also be well rolled, and if previous to rain a little finely sifted gravel were put on and rolled in, it would greatly improve their appearance.

CARPET BEDS.—I would suggest to those contemplating carrying out a design, not to attempt more than they have plants sufficient to carry out well. For the benefit of those who may not be so well versed in the number of plants required, I may state, if they arrange Golden Feather, *Alternanthera*, *Echeveria secunda glauca*, with *Koniga*, *Mesembryanthemum*, &c., at 4 inches apart, they will not be far wrong; some single plants may take more space than this, but this will be found a fair average.

COLUMNAR BEDS.—The first idea of the formation of these beds originated in a miniature form, which is at present retained. With wire netting  $\frac{1}{2}$  inch mesh and 1 foot 3 inches high forms a column of 5 inches in diameter and set it on a circular piece of wood 8 inches diameter, place it in an ornamental Staffordshire glazed pan. The column and pan are to be filled with stiff loam, pricking the whole full of *Selaginella Kraussii* (*denticulatum*) with a Fern on the top, placing it in a warm house. In the course of a few weeks it will be covered, presenting one of the prettiest ornaments for the centre of a table that can be imagined.

BEDDING PLANTS.—All glass structures at command should be overflowing with plants in preparation for use in the open air. The great difficulty often experienced is, not the striking of the cuttings, but the place to put them in when potted off. Bedding *Pelargoniums* should be well hardened off in cold frames or temporary structures prepared for the purpose previous to planting out in the flower garden. Continue to prick off seedlings as they advance, and take care of such plants as *Lobelia*, *Petunias*, and *Verbenas* raised from seed; although they are not to be trusted to for planting in the principal beds or borders they come in very handy for side borders, &c.

WINDOW BOXES.—These will occupy the attention of most gardeners at this season of the year. It is essential that they should be well furnished, and *Pelargoniums* form a prominent part, with yellow *Calceolaria* and white Stocks, intermixed with *Lobelia speciosa* and *Petunia*, plant and plant hanging over the edge of the box. This will make one of the prettiest window boxes that can be imagined. They should be filled and placed in a cool house or frame for a fortnight or three weeks, to get well established before placing them in the windows. *W. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, April 26	Sale of the Freehold Property, Beech Nurseries, Southend, at the Auction Mart, by Protheroe & Morris. Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 11 A.M.: Scientific Committee, at 1 P.M. Manchester Botanical and Horticultural Society's Spring Show, and National Ariculture Society's (Northern Section) Show, in the Town Hall, Manchester
TUESDAY, April 27	
WEDNESDAY, April 28	Clearance Sale of Stock in Trade and Glass Erections, at Baker's Farm, Willesden, by Protheroe & Morris. Sale of Bleak House and 10 acres of Freehold Land, at Catesham, Surrey, at the Mart, by Starbham, Hobson, Richards & Co.
THURSDAY, April 29	Sale of an Importation of Orchids from Burmah, at Stevens' Rooms.

FROM time to time we have spoken in strong terms of the folly and futility of the precautions taken by various foreign Governments, as well as by some of our colonies, against the invasion of the PHYLLOXERA. No one will impute to us insensibility to the ravages of this frightful pest, no one will accuse us of disparaging any legitimate and rational measure of precaution; but the means proposed are not rational—they are simply stupid. They will in all probability fail in their object; they will, nay, they have already effected a wholly unwarrantable injury on horticulture and the industries connected therewith.

We have now before us the full text of the Convention at Berne of September 18, 1878, agreed upon by plenipotentiaries from the Swiss Confederation, His Majesty the Emperor of GERMANY, King of Prussia; His Majesty the Emperor of AUSTRIA, Apostolic King of Hungary; His Catholic Majesty the King of SPAIN, the President of the French Republic, His Majesty the King of ITALY, and His very faithful Majesty the King of PORTUGAL. These very faithful, catholic, apostolic, and republican personages, by their representatives, have enacted and ratified (December, 1879) a joint convention, and after taking some months to consider its terms, have approved and do approve all and several the arrangements made, and promise that they shall be inviolably observed. This, in substance, say they all—in French, in German, or in Portuguese, while His Majesty of AUSTRIA makes use of the Latin tongue, and declares:—"Nos visis ac perpensis conventionis prædictæ articulis, illos omnes et singulos ratos hisce gratosque habere declaramus, Verbo Nostro Cæsareo Regio spondentes, &c." As it is impossible to credit these august personages with any but the most benevolent and high-minded intentions towards their subjects, we can only regret that their good purpose was not sought to be effected with a little more knowledge of the habits of the Phylloxera. It is to be regretted that, while advocating every reasonable precaution against the attack of the insect, and adopting the most stringent means for its destruction in places where unhappily it has appeared, they did not also see to it that the regulations enacted were at once likely to be effectual for the intended purpose, and not injurious in any other way.

Here are, in substance, the principal enactments of this international convention:—

Art. 2. Wine, table Grapes without leaves or shoots, Grape seeds, cut flowers, market garden produce, seeds of all kinds and fruits, are permitted to be circulated freely. (Italy and Spain have not ratified the convention because the terms are not sufficiently stringent, and from what we have seen and heard of the proceedings at Italian custom-houses, the Italian regulations may bear the palm for absurdity.)

Plants, shrubs, and various products of nurseries, gardens, greenhouses, and conservatories, cannot be introduced into one state from another except through certain custom-house establishments, designated for this purpose by the contracting parties, and under the conditions defined in Art. 3.

Uprooted Vines (*arrachées*) and dried Vine canes (*sarments*) are excluded from international circulation.

Neighbouring states will come to a mutual understanding for the admission of Grapes for the vintage, crushed Grapes (*marc*), composts, trellises, training stakes already used, with the reserve condition that these objects do not come from an affected district.

Art. 3. The objects (above enumerated) as being allowed to be transported from country to country through the medium of certain specially designated custom-houses must be accompanied with an authoritative certificate stating,  $\alpha$ , that they come from a district reputed to be free from phylloxera, and specified as such on a special map kept revised up to date by the several states;  $\beta$ , that they have not been recently introduced.

Vines, cuttings and shoots, can only be transmitted in closely fitting cases screwed down, but easily opened for purposes of inspection.

Plants, shrubs, and various products of nurseries, gardens, conservatories, are to be solidly packed, the roots completely divested of soil (!); they may be surrounded by moss, and covered in any case by packing-cloth, so as not to allow of the escape of any *débris*.

It is not necessary to cite any more of the regulations, of which we have given the substance nearly literally. Any one conversant in any degree with the nature of the insect, will see that these regulations must be futile—that their good effect, if any, can be but accidental and temporary, and that, on the other hand, great injury is likely to be done to horticulture and commerce. These regulations appear to be as reasonable as it would be to treat a man who had one foot frost-bitten by plunging his other foot into a furnace.

It is unfortunately not possible to do much either in the way of prevention or of cure. What little can be done in this way should be done as thoroughly and stringently as possible; but it is not necessary, as the high contracting parties are now doing, to pile a second and wholly unnecessary evil on the top of the first.

— JAPANESE NURSERIES. — Among the very interesting photographs brought from Japan by Mr. MARIÉS, and which were exhibited recently before the Royal Horticultural Society, was one representing a Japanese flower-shop which was so characteristic that we sought and obtained permission to reproduce it in our columns (fig. 94). It represents a portion of Mr. KOSOBURO's nursery at Yokohama, and shows the proprietor with the members of his family surrounded by their floral treasures, among which later may be seen the *Sciadopitys* in a small vase, the *Raphis flabelliformis*, various Cycads, &c. Among the Mongol faces is one of an Anglo-Saxon type surmounted by a very English-looking straw hat. The intruder among the Japanese domesticities is none other than Mr. MARIÉS himself, to whose exertions we owe so many fine introductions among Conifers and other plants. It may be interesting at this time to quote the late Mr. FORTUNE's account of his visits to some Japanese nurseries, which runs as follows:—

"The whole country here (outskirts of Yedo) is covered with nursery gardens. One straight road more than a mile in length is lined with them. I have never seen in any part of the world such a large number of plants cultivated for sale. Each nursery covers 3 to 4 acres of land, is nicely kept, and contains thousands of plants both in pots and in the open ground. . . . On entering the gateway a pretty little winding pathway leads up to the proprietor's house, usually situated near the centre of the garden. On each side of this walk

are hardy ornamental trees and shrubs of the country, often dwarfed or clipped into round table forms. The beautiful little Yew—*Taxus cuspidata*—occupies a prominent place among dwarf shrubs. Then there are the different species of Pines, *Retinosporas*, *Thujas*, and the beautiful *Sciadopitys verticillata*, all duly represented. Plants cultivated in pots are usually kept near the house of the nurserymen, or enclosed within a Bamboo fence. Glasshouses are not yet in use for rearing tender plants, instead of which sheds and rooms fitted with shelves are used, into which the Japanese huddle them, for shelter during the cold months."

In one garden he found nothing but varieties of *Acorus* growing in square Nanking pots (fig. 92), and in each pot was a rock of agate, crystal, or other rare stone, many of them representing the famous Fusi-yama, or Matchless Mountain of Japan (fig. 93).

— Mr. W. H. FITCH.—It is with great satisfaction that we are enabled to announce that a pension of £100 per annum from the Civil List has been awarded to Mr. W. H. FITCH, F.L.S., in consideration of his services to botanical science. There can be but one feeling, that in this matter a very right thing has been done.

— PROFESSOR BAYLEY BALFOUR. — We learn that this gentleman, whose arrival at Socotra we noted, as it were, only the other day, has returned after a short sojourn in that island, bringing with him large collections in zoology and other branches of natural history, including living and dried plants, drawings, &c. We heartily congratulate the zealous Professor on his safe arrival, and on the success which has attended his expedition. Professor BALFOUR has suffered from an attack of fever, which has enfeebled him, but he is otherwise in good health. We look forward with the greatest interest to the narrative of this brilliant dash into a next to absolutely unknown territory.

— ROBERT FORTUNE.—From various quarters—from Germany, France, and Belgium, as well as from our own country—we have received letters expressive of admiration of FORTUNE's labours. Surprise has also been expressed that we have not given a portrait of the famous botanical collector. This arises from no fault or neglect of ours. We had repeatedly asked our friend to allow us to gratify our readers, and permit us to pay him this homage. Within the last month also we repeated our request, but from various reasons without success. The following letter, written to us some time since, will suffice to indicate the esteem in which he was held in other countries than our own:—

"I have read with pleasure the notice of this great botanical traveller and successful author. Though England counts him among her children, all Europe is under obligation to him. There are no gardens deserving the name that have not been enriched by his introductions. Had he only introduced *Chamerops Fortunei*, the only hardy Palm we have, we should have owed him a debt of deep gratitude. English, French, Belgians, Germans, Italians, Spaniards, we are all under such obligations to him that to forget them would be ungrateful. P. JOSEPH-LAFOSSE, *Saint Come du Mont près Carantan.*"

— CONGRESS OF ITALIAN HORTICULTURISTS. —The first national exhibition of the Federation of the Horticultural Societies of Italy will be held in Florence from May 15 to 24, on which occasion a congress will be held for the purpose of consultation and discussion on matters relating to horticulture in Italy. Cav. EMANUELE ORAZIO FENZI is the President, and the subjects named for discussion are:—

- "The utility of horticulture on morals and material welfare of humanity."
- "Mode of establishing horticultural societies in the principal cities of Italy."
- "Schools for instruction in practical horticulture."
- "New varieties of plants, flowers, and fruits."
- "Pomona Italiana."
- "Dry and preserved fruits."
- "Commercial products, imports and exports of horticulture."
- "The Phylloxera."

— PROFESSOR BALDWIN.—The *Irish Farmers' Gazette* understands that Prof. BALDWIN is about to retire on a well-earned pension from the appointment he has so ably filled for many years as Superintendent of the Agricultural Department of the National Board, Dublin.

— **HARDY SPRING FLOWERS.**—Among many other things in flower at Mr. WARE'S Hale Farm Nurseries, Tottenham, are a few which deserve mention; such as extra fine examples of *Cypripedium macranthum*, many varieties of *Fritillaria latifolia*, *Trollium*, and *Primula cortusoides amœna* [Sieboldii]; *Iris persica*, several varieties of *Mertensia*, the yellow *Corydalis bracteata* and *C. nobilis*, an innumerable variety of *Narcissi*, *Muscari atlanticum*, *M. Szovitzianum*, *Erythronium purpureum*, *E. giganteum*, &c.

— **THE QUEEN AT LAEKEN.**—On her return from Baden Baden, Her MAJESTY paid a short visit to the King and Queen of the BELGIANS at Laeken, and was conducted by the King through the State apartments. Their Majesties and suite also visited

Orchids, &c., sent by special messenger from London for presentation to their Majesties and the Royal Princesses.

— **PLUMS.**—We do not now associate an abundance of ripe Plums with cholera, or indeed with milder forms of sickness. What superstition of that nature once existed is now pretty well dead, and we can learn to regard an abundance of the succulent fruit not only with equanimity, but also with considerable pleasure. Plum crops are scarce visitors; that is, a Plum crop which is worthy of the name. In nearly all gardens there are found annually a few fruits more or less, but this small quantity gives few indeed to the million. It is when fruit is plentiful—when the trees are heavy laden, and a dry time permits of the

Nature is active. In the hope that the trees will bring forth this year a big crop, it will be well if housewives will get ready the jam-pots, and prepare for a busy preserving season.

— **OROBUS ALPESTRIS.**—This species, which is a near ally of *O. vernus*, is now in company with the latter, and several of its varieties, flowering at Kew. *O. alpestris*, a native of Hungary, has narrow leaflets and purplish-red flowers, and is a more slender plant than the much commoner *O. vernus*. A very striking variety of the last named is *cyaneus*, which bears a profusion of metallic blue blossoms; *albus* is a form with fine creamy-white flowers, and *O. flore-pleno* is a double one, white suffused with red. There are few more charming border plants than these old-fashioned

FIG. 94.—A JAPANESE NURSERY GARDEN. (SEE P. 528.)

the gardens, and minutely inspected the magnificent conservatory, which is the largest and handsomest structure in Europe; also the subterranean corridors and theatre, which have been erected at enormous cost, and furnished in good taste. Her MAJESTY seemed impressed with the appearance of the Palms and Tree Ferns, which have been removed from Enghien at such a heavy cost, and appreciated the natural effect produced by the grandeur of the stately Palms, and the natural setting of Ferns, Begonias, and various other ornamental plants. On leaving the conservatory, Mr. WILLS, who has been engaged to carry out the decorations of the large conservatory, &c., was presented by His Majesty King LEOPOLD to the Queen VICTORIA, when Her MAJESTY was pleased to compliment Mr. WILLS on his success. Mr. WILLS was permitted by His MAJESTY to have handsome bouquets, composed of Tea-scented Roses,

fruit being sent to market in good condition—that the masses get their share, and for one season all alike rejoice in the great abundance. Market growers, who are practical men, and judge of the fruit seasons by the returns they give pecuniarily, tell us that we get a fair Plum season about once in five years, with intermittent sprinklings. It is now five years since we had a marvellously heavy crop, and it would seem to have taken the trees all the intervening time to get strong and productive again. Are we now again to reap the fifth year crop, as the trees now full of bloom promise a great abundance of fruit? That the wood and fruit-buds on the Plums are matured there can be little doubt, as these are formed early in the summer, and the now expanded bloom has a healthy, vigorous appearance. Further, the weather is so far propitious, as the change of wind has brought a most favourable temperature, and

herbs, with their elegant, brilliantly coloured, pea-shaped blossoms.

— **NATIONAL ROSE SOCIETY.**—We are informed that a meeting of the executive committee was held at the rooms of the Horticultural Club on the 13th inst., GEORGE BAKER, Esq., Vice-President of the Society, in the chair, when various arrangements connected with the forthcoming exhibitions of the Society were made. Judges were selected, and amongst other decisions arrived at were the following:—That on the day of the Crystal Palace exhibition a *dejeuner* would take place at 1 o'clock, open to any members of the Society who might wish to join, and that certain members of foreign Rose societies would be invited as guests; that silver-gilt and silver medals of the Society would be presented to the Society of Rosarians at Antwerp, and to the

Society of Erie-Comte-Robert, to be allocated according to the wishes of their respective committees, this presentation being made in response to offers of a similar character made from the President and Secretary of those Societies. We are also informed that two errors have unfortunately crept into the schedule, and are requested to state that in Class 21 it should be "8 distinct," instead of 6; and in Class 22, "24 distinct," instead of 8. Those classes are correct in the schedule issued by the Crystal Palace Company. Members of the Society should remember that, by the arrangements made with the Crystal Palace Company, they will have the privilege of admission to the exhibition for half-an-hour before the general public.

— THE ORCHIDS AT LAKE HOUSE, CHELTENHAM.—Amongst a number of Orchids we lately saw flowering in Mr. WYATT'S collection at Lake House, Cheltenham, the following were particularly noticeable:—

Dendrobium lituiflorum	Odontoglossum Roezlii
„ suavisimum	„ „ album
„ crassinode	„ „ triumphans
„ chrysotoxum	„ „ Cervantesii
Cymbidium Lowianum	„ „ Hallii
Oncidium concolor	„ „ cirrosium
„ „ Weltoni	Lycaste Skinneri
Cypripedium villosum	Epidendrum vitellinum

—with many others coming on, including a plant of *Dendrobium Falconeri*, grown cooler than usual; it was flowering freely from two or three joints each of the numerous small slender bulbs, and when the blooms were expanded would be very much fuller than it is generally seen. When well flowered this is one of the most beautiful as well as elegant habited of all Orchids. Near it was a specimen of the equally handsome *D. Devonianum* with eleven blooming bulbs, the longest of which were 3 feet in length, and proportionately stout.

— FLOWER SHOW AT TURNHAM GREEN.—The show of spring flowers which is to be held in the new Vestry Hall, at Turnham Green, on Thursday next, in aid of the funds of the West London Hospital, promises to be of an unusually interesting character, as besides the numerous subjects that will be brought out in competition for the prizes, the Messrs. VEITCH, HERBST, HOOPER, ALDOUS, and other nurserymen, as well as the newly formed General Horticultural Company, have promised to contribute from their stores of horticultural wealth. A special feature in the arrangement, which appears to be exciting much local interest, is the throwing open of the Royal Horticultural Society's Gardens for promenading to all who visit the show. The general management is in the hands of Mr. A. F. BARRON, and we trust the day may be fine, and the visitors as numerous as at the Chiswick *filtes* of old.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, April 26, when the adjourned discussion on the paper by Mr. C. G. SAUNDERS, on "Quantities and Quantity Practice," will be resumed. The chair to be taken at 8 o'clock.

— ORCHIDS AT DAVENHAM BANK, MALVERN.—In Mr. J. D. FERRIN'S collection there are a number of very fine plants, principally cool and intermediate heat-requiring species. A specimen of *Masdevallia ignea* has sixty-three flowers, *M. Veitchii* twenty-six flowers, *M. Harryana*, 2½ feet across, not yet in bloom: last season it had open at one time 150 flowers; *M. Davisii* forty strong bulbs, *M. Chimera*, *Ada aurantiaca* had open eleven stout spikes of its bright orange blooms; *Arpophyllum giganteum* pushing eighteen erect densely packed bloom-stems, the plant 3½ feet through; *Dendrochilum glumaceum* with seventy elegant drooping racemes. Smaller specimens of the following were also in flower:—

Odontoglossum crispum	Cypripedium villosum
„ „ Hallii	„ „ barbatum
„ „ Pescatorei	„ „ niveum
„ „ cordatum	„ „ Sedeni
„ „ gloriosum	Dendrobium Wardianum
„ „ Cervantesii	„ „ crassinode
„ „ Inseayi	„ „ thyrsiflorum
„ „ Alexandræ	Phaius maculatus
„ „ luteo-purpureum	Lycaste Skinneri
„ „ pulchellum	Cattleya Trianae, many vars.
Sophroneites grandiflora	

Amongst several very fine plants of *Odontoglossum vexillarium* is one with eleven very strong leads, grown from a single bulb in five years. In the warm division is an extraordinary plant of *Vanda suavis* (VEITCH'S variety); it consists of six strong growths,

the largest of which is over 5 feet high from the top of the pot, with all the leaves fresh and healthy right down to the bottom: it is showing twenty-seven spikes of flowers, and when in bloom will no doubt be a specimen such as is seldom met with.

— NATIONAL AURICULA SHOW: NORTHERN SECTION.—We may remind our readers that the Northern section of the National Auricula Society will hold its show in Manchester on Tuesday next, April 27, when, judging from the appearance of the flowers shown at South Kensington on Tuesday last, a good gathering may be anticipated. It is highly gratifying to see the increased interest which is being taken in this favourite flower. Those of our Southern growers, however, who may elect to try their luck in the North, must remember that the strict properties in all the groups are more vigorously followed in making awards than they are in the South; by which we do not mean that inferior flowers have a better chance southwards than northwards, but that the points adopted are somewhat different—for example in the North an alpine Auricula must be a shaded flower, while here in the South both shaded and unshaded flowers are admissible. The exhibition will be held in the Town Hall in conjunction with the spring show of the Botanical and Horticultural Society.

— CATTLEYA SKINNERI.—The Hon. and Rev. J. T. BOSCAWEN sends us a grand specimen of this fine old Orchid. The plant is, we are informed, growing in an 8-inch pot, and has produced seven noble spikes of its large exquisitely coloured blossoms, all being in bloom together. On the spike before us there are nine finely developed flowers. The plant must be a model of successful cultivation, and we need not wonder that its owner is enraptured with it.

— HYDE PARK DECORATIONS.—We understand that the authorities have arranged with Mr. ANTHONY WATERER, of Knap Hill, to furnish an annual display of American plants in Hyde Park, the plants being removed and replaced every season, or as frequently as may be found necessary. No better arrangement could have been made for the pleasure of the sojourner or resident in the metropolis, and no better locality could have been selected for bringing them under the view of all classes. Already we observe there are some beds planted with hardy Azaleas, a tribe of plants whose glowing colours, if the spring at all favours a kindly development, will light up Rotten Row as it was never yet wont to be lighted. The rich and sparkling colours of these Azaleas, and the fragrance given off by some of them, are quite enchanting, and it has always been a subject of regret that they have bloomed and faded away unseen, except by the comparative few who make an annual pilgrimage to Knap Hill. The Azaleas have not often been a prominent feature at the Rhododendron shows held in the metropolis, as the flowering season of the two subjects does not quite coincide; but once get them to bloom but freely in Hyde Park, where everybody can see them, and they are certain to make their mark, and to create a floral sensation. They have been so much improved, too, of late, that it would be a matter of regret if they did not again—as they used to do—attract the notice of those who have American gardens to decorate. In the case of the Azalea beds already planted, we notice that Mr. WATERER has introduced, for present effect, an edging of what we understand is to be called the Hyde Park Yellow Polyanthus, a hose-in-hose variety of the richest golden-yellow, which has come into Mr. WATERER'S hands, and which thrives amazingly in the Woking soil and atmosphere. Just now it may be seen in very effective condition, planted in strong clumps, closely together, as a margin to the beds of Azaleas, which are in many cases large plants, 5 to 6 feet in height, and splendidly furnished with buds.

— SEXUAL DIFFERENTIATION IN EPIGÆA REPENS.—In his *Synoptical Flora of North America* Dr. ASA GRAY states that the flowers of this are heteromorphous and inclined to be diœcious or diœciodimorphous. Mr. LESTER F. WARD, as we learn from the *American Naturalist*, has been studying the subject, and read a paper thereon last September before the American Association for the Advancement of Science at Saratoga. He found *Epigæa* to be diœcious or subdiœcious. The staminate flowers are,

in all respects, much larger than the fertile ones; and all the flowers in a patch were invariably found to be of the same kind—either all staminate or all fertile. The amount of surface covered by staminate plants greatly exceeds that covered by the fertile ones. There is an actual discrepancy in the measurement of the flower, amounting to about 30 per cent. in the length and about 40 per cent. in the width of the corolla. The fertile plants often fail to fruit, so that fruiting specimens are rarely met with.

— SAXIFRAGA FLAGELLARIS.—At Kew this pretty *Saxifraga* is now flowering freely. From the centre of the rosette of spatulate, spreading, ciliated leaves, springs the flower-stem, which bears from one to three yellow flowers. The number of long filiform stolons, bearing at their extremities small buds which serve to reproduce the plant, originated, without doubt, the name of Spider-plant, given to it by the sailors of the various Arctic Expeditions. It is a native of the Arctic regions of both hemispheres.

— CURRANT BUSHES ON RAILWAY BANKS.—In the last number of the *Flore des Serres M.* PUTZEYS makes a practical suggestion as to the utilisation of these waste spaces, and after enumerating various shrubs whose use is more or less general, he goes on to recommend the culture of the common Currant (*Grossella communis*). Its roots would bind the soil well, its foliage would prevent the drying of the soil, its propagation is easy, and its fruit are commercially valuable. We strongly commend the notion to the authorities. Raspberries, Strawberries, and many other plants might be grown in similar fashion, and would require little attention, the primary object being the maintenance of the banks, not the quality of the fruit.

— GREVILLEA THELEMANNIANA.—Forelegance and grace of habit, combined with beauty of foliage and flowers, few West Australian plants surpass this—one of the most desirable of cool greenhouse plants. The pale green feathery leaves are not unlike those of some *Artenisias*, and the flowers—which are very freely produced even by young plants—are pink, with green tips. In a recent volume of the *Botanical Magazine* the species was figured under the name of *G. Preissii*. Plants are now blooming in the temperate-house at Kew.

— BAGSHOT AND WINDLESHAM HORTICULTURAL SOCIETY.—The annual exhibition will take place on Tuesday, July 6, by the kind permission of H.R.H. the Duke of CONNAUGHT, in Bagshot Park.

— PUTNEY AND DISTRICT CHRYSANTHEMUM SOCIETY.—The third annual exhibition of this Society is fixed to take place at the Assembly Rooms, Putney, on Tuesday, November 16.

— THE WEATHER.—General remarks on the weather during the week ending April 19, issued by the Meteorological Office, London:—The weather during the first few days was very rainy and unsettled, but by the 7th it had become fine generally, and continued so, except at some western stations, during the remainder of the period. Thunderstorms, with hail, were experienced over the Channel generally on the 14th, and at Hastings, Dover, and Yarmouth on the 15th. The temperature was about equal to the mean in Scotland and the southern and eastern parts of England, but slightly below it in all other parts of the kingdom. The thermometer was generally highest during the latter part of the period, and on the 19th rose to 69° at Cambridge, and 67° in London. The lowest of the minima occurred at most places on the 14th, and at Blackpool a reading of 28° was recorded. The rainfall was more than the mean in all districts, except "England, N.W.," the excess being rather large in Ireland and the south and east of England. Bright sunshine showed a slight increase over the greater part of England, but a decided decrease in Scotland and Ireland. In the "Midland Counties" and "Ireland, N." the sun was only to be clearly seen for about a fifth of the time it was above the horizon. The wind was generally north-easterly during the first three days, but on the 16th it changed suddenly to south-west in the south, and to east in the north, and on the three following days a southerly current prevailed all over the country. In force the wind was generally moderate in the east and south-east, but fresh or strong in the west and north-west, and on the 18th blew a strong gale at many of our western stations.

## A NEW CROCUS FROM TURKESTAN.

(Continued from p. 235, vol. xii., 1879.)

**CROCUS KOROLKOWI.**—About a fortnight ago I received from Dr. Regel, under the name of "*Crocus aureus*, Sibth.," specimens of an orange *Crocus* from Samarkand, which, I have no doubt, is an undescribed species. In general aspect it resembles a small form of *C. aureus*, with the outer segments externally suffused with dull purplish-grey. The most essential character in which it differs from *aureus* is in the structure of the corn tunic, which consist of a thin membranous base interlaced with true fibres. These are generally parallel, though tending to a reticulated arrangement. The corn tunic of *C. aureus*, though apparently made up of fibres, is in reality cartilaginous, produced towards the base of the corn into flat linear parallel divisions. There are also good distinguishing points in the leaf-structure, as well as in the anthers and stigmata, which I need not here refer to. Dr. Regel accepts the plant as a new species, and suggests its being called *Crocus Korolkowi*, under which name it will shortly be described in the seventh fasciculus of his *Descriptions*.

*Crocus Korolkowi* was collected by Fedtschenko around Samarkand, at Dargam, near Samarkand, and in the valley of the river Sarawschan in Kokania. It was also collected by Korolkow during the Russian expedition to Chiwam, between Taschkent and Karak-Ati, as well as in the Kara Tau Mountains near Boraldai in Western Turkestan.

This discovery is of special interest as regards the eastern extension of the genus. *Crocus Korolkowi* seems to be generally distributed between 40° and 45° N. lat., and 67° to 71° E. lat. No other orange *Crocus* has before been known to occur east of the borders of the Black Sea, distant 1300 miles west of Samarkand, and its habitat forms an intermediate stepping-stone between the West Caspian district, till lately supposed to be the most eastern limit of the genus, and the Ala Tau range, the home of *C. alatavicus*, which is 400 miles still further to the east in Central Asia. The occurrence of these two species in a region so far removed from the remainder of the genus opens up an immense area, hitherto so little explored, in which many more species may yet be met with. *C. Korolkowi* has the aspect of a vernal species, though no record of the date of collection accompanies the specimens sent me by Dr. Regel. *George Maw, F.L.S., Benthall Hall, near Broseley, April 17.*

## Home Correspondence.

**In Memoriam: Robert Fortune.**—I read of the great collector's and public benefactor's death with the most acute regret. When a few months since my good neighbour, Mr. Grieve, wrote of his claims on the honour and gratitude of horticulturists, I was requested to take the matter up, but the opportunity passed, and now I hear only the words, "Whatsoever thy hand findeth to do, do it with thy might," and do it at once. Robert Fortune is gone, and your leader is a fitting memorial to him; but I cannot help joining you in a protest against the powers that be in their neglect of such men as Fortune while rewards thick as Blackberries are showered down upon those whose claims are but of a temporary nature. Fortune devoted health, strength, life, to enrich his country with the beautiful and useful vegetation of a new, because previously unopened world. He bound India to us with stronger ties than a scientific frontier. He introduced a new industry, which is destined to cement India to us by more friendly and lasting bonds than that of the mere promises of vassal chiefs. In his efforts to introduce and establish Tea culture in India he virtually opened a mine of wealth which is destined not only to enrich but civilise our vast empire in the East. But all these patriotic works went for nothing with our higher powers. And yet how we all long to honour him. Surely we horticulturists can, if no one else will. Let us ask the Society of Apothecaries to grant us a site in the Botanic Gardens at Chelsea for a marble or granite bust of our good, great, truly noble, though still simple Robert Fortune. I shall be glad to contribute a guinea to this purpose. David Douglas has a simple monument in the kirkyard of New Scene. A bust at Chiswick or at Chelsea, enwreathed with some of Mr. Fortune's

best and most useful introductions, would be a fitting testimonial from the horticulturists of Great Britain to Robert Fortune, collector, author, patriot, philanthropist. *D. T. Fish.* [To us it appears that Chiswick is the proper place, and the Royal Horticultural Society the proper body to carry out the movement. Meanwhile we shall be pleased to help forward so worthy a cause. *Eds.*]

**Narcissus ornatus.**—Welcome as are all spring flowers, none are so much so as this, the most useful of all *Narcissi*. As I write, there are before me four large beds with many thousands of fully expanded blooms. For Easter decorations this species unrivalled, blooming as it does between March 25 and the middle of April; in foliage it is slightly different from *N. poeticus*, but in colour and shape of flower it is hardly distinguishable from that species, and I am confident that, when it gets to be better known it will be grown in quantity by the legion of caterers for Covent Garden and other flower markets. It requires no particular preparation of soil, and is so hardy, even when in bloom, that when, as frequently happens, a heavy fall of snow completely covers it, it will, when the snow melts, be as fresh as ever. Another good thing is now in bloom, viz., the silver and gold striped double Daffodil, now so seldom seen in collections. *M. W. W.*

**Dynamite for the Removal of Roots.**—Dynamite is the invention of Mr. Alfred Nobel, a Swiss mining engineer, and has been before the public for the last ten or twelve years, and for the past few years has been brought into requisition for many purposes where other explosives would have been of little use: Amongst them may be named the blowing up of Hell Gate in New York harbour, the smashing up of the *Vanguard*, and lately the operations at the scene of the lamentable accident at the Tay Bridge, where it has been used for breaking the massive girders under water. It is not necessary for me to reiterate the many uses to which it has been put; my present object is to give a few practical details respecting the use of it in removing tree roots out of ground. In the park here our usual method was blasting them with powder or grubbing them up, but this we found a slow, tedious, and expensive process. In this age of progress we were determined to try the more expeditious mode of removing them by dynamite. For the information of those who have not seen this substance, it may be interesting to note a few particulars of it. Dynamite is composed of 75 per cent. of pure nitro-glycerine, and 25 per cent. of an infusorial or porous earth, which is procured from the bottom of some of the German rivers. This earth is ground and prepared finer if possible than the best biscuit flour, and when looked at through a powerful microscope every grain is porous, or in other words, honey-combed, so that each grain soaks up and retains its share when mixed of nitro-glycerine. The above proportions are just sufficient to make the dynamite plastic or pasty without allowing the liquid nitro-glycerine to exude. In appearance it is of a reddish colour, and is made up into cartridges of different sizes varying from 1 to 2 inches diameter and 4 inches long. In the park here we have been recently felling trees for the purpose of doing away with the hedgerows and crowded appearance of this part of the estate, to improve the landscape and allow those which are left to fully develop themselves. Owing to most of the trees having grown in hedgerows they have formed much stronger roots than if they had been grown in a wood, therefore more labour and explosives were required to take them out of the ground. The tools or implements required are of simple description, viz., an earth-auger, which is similar to an old-fashioned wood auger, 2 inches diameter at the bit, and about 4 feet long, and fitted with a slightly hollowed shield or cap which the man fits against his chest when boring, and which is used for boringholes between the fangs; a crowbar, grafting and stock axe. These are all the implements that are required. The operation is as follows:—Suppose a large root is to be removed out of the ground, a hole is made with the earth auger as described above, between two of the strongest fangs; this is put in at an angle, so that the bottom of the hole is as near under the centre of the root as possible. The hole is then charged with a few cartridges of dynamite, according to the size and strength of the root, a primer cartridge containing cap and fuse is then inserted on the top of the charge, and the whole rammed down with loose earth by a wooden rammer. The end of the fuse is then lighted, this explodes the cap, and that in its turn the dynamite, and the whole mass is usually blown out, breaking up the root into convenient pieces for loading up or burning. The fuse is cut off at sufficient length so as to allow the workman to get out of danger, which is usually from 50 to 100 yards, according to the strength of the charge. After the charge has exploded seldom anything remains but a large hole much resembling the bed of a boiler. I took particular notice that

no damage whatever was done to the surrounding trees. We had nearly 400 roots got out by this process, and with two of our common labouring men, with one man sent by the agents representing the Dynamite Co., Messrs. Johnson & Co., Dudley, we have been able to remove from twenty-five to thirty per day of roots averaging from 1 foot 6 inches to 4 feet 6 inches in diameter. I find from careful calculations made that we have been enabled to remove the roots in a far more expeditious manner than hitherto, and at from 50 to 60 per cent. less cost. No one need be prevented from using dynamite on the score of its being dangerous, for with ordinary care it is in my opinion as safe to use as gunpowder. From my recent experience in the use of dynamite in removing tree roots, I can with confidence recommend it for that purpose. *J. Smith, Mentmore, Bucks, April 19.*

**Propagation of Bedding Plants.**—The requirements for bedding out here are considerable, one border alone taking over 8000 plants, but we make short work of their propagation. About 1 inch of cocoa-nut dust is spread on the slate benches in the stove-house, and the cuttings inserted thickly, just as they are taken off (without removing the two lower leaves, as is usually advised), and covered with glass resting on strips of wood 3 inches high. *Ageratums*, *Alternantheras*, *Coleus*, *Iresine* and *Verbenas* strike root freely in a week, and are then pricked out in light soil in shallow wooden boxes. Old brandy cases cut in halves answer admirably, as being not only of a handy size for carrying, but where it is necessary to economise space, as it is here, they are infinitely preferable to the circular pans or pots in ordinary use. Ample drainage is secured by making five or six holes in the bottoms of the boxes—only a few minutes' work with a centrebit. *George Duffield, Winchmore Hill, N.*

**Ivy-leaved Pelargonium, St. George.**—I send you a truss of flowers from one of my hybrid Ivy-leaf *Pelargoniums*, *St. George*. You will see there are four distinct flowers on the truss, the lightest coloured flower being the true colour of *St. George*. This is the first truss I have had come in this way. The flaked flowers would be very nice if I could get it to come true. I shall strike the shoot and see if it will do so. *J. George, Putney Heath.* [A very interesting sport, the flaked flower especially. *Eds.*]

**Hardy Cypridiums: Primula villosa.**—Allow me to correct an error in "N.'s" article on hardy *Cypridiums*, p. 490. Describing *C. pubescens*, he says, "Flowers precisely similar to *C. Calceolus*." They are very different, *C. pubescens* being all yellow, and *C. Calceolus* yellow and purple. (See Redoute's figures, Nos. 19 and 20.) *C. pubescens* is a most common plant, much easier to grow, and a more abundant flowerer. In what parts of the North of Scotland does "R. L." find *Primula villosa*? (p. 500). No one else seems to have found it there. [No doubt, a mistake.] *Henry N. Ellacombe, Bilton Vicarage.*

**Rating Hothouses.**—This subject was raised in the pages of the *Gardeners' Chronicle* some years ago by Messrs. Protheroe & Morris, who suggested that the matter should be tested by bringing a case into court, and there the matter dropped. To the writer it seems the present is a favourable time for reviving the subject, when many of the nobility and gentry of these islands sell the produce of their gardens, and are practically market gardeners and nurserymen, and when we have great joint-stock co-operative market gardens and nurseries, with many names of the Upper Ten Thousand as directors, advertising that by that means they hope to dispose of the produce of their gardens to the best advantage. Such competition is no doubt a serious matter for the man who has invested his means with a view to getting a living by his trade as a nurseryman or market gardener, yet he would have no right to complain were he not handicapped in the race to a very serious extent. To illustrate, I will give a case from each side—real ones. One man hires 4 acres of land, that was let for 30s. an acre for agricultural purpose; he erects £3000 worth of glass on it for the production of fruit for market, and a dwelling-house. The assessor comes round and assesses him at £215 a year. He returns his income at £600 a year, and after a time is called upon to produce his books to prove that his return should not be increased—said books prove that he had made an ample return. Thus for the produce of 4 acres of poor land with structures on it that are not heritages—as it has been proved in a court of law, that if put up for trading purposes they can be removed, and do not become part of the freehold—one man is assessed on £215 and has to pay income tax on £600. The other case is that of a nobleman who encloses 20 acres of land, which previous to enclosure was let as a market garden at £12 an acre—equal to £240. He has erected a fine gardener's house, and all other

necessary buildings, with numerous ranges of glass. He sells all that can be spared of the produce, and in turning up the rate-book for his county I find he is rated at £120 a year. I do not know what return he makes to the Income-tax Commissioners, but I am morally certain he does not return £600 a year. I call the assessor's (in my county) attention to this and similar cases, he shrugs his shoulders, and says, "I know nothing about it. It is not in my jurisdiction, and noblemen's gardens are not kept for profit, they are luxuries and are lightly taxed." This may have been true when noblemen and gentlemen, as in my early days, gave their gardeners a list of friends and neighbours to whom to give, with their compliments, any surplus fruit or vegetables there might be after their own wants were supplied, but the case is altered when some of them have gone the length of taking their gardeners into partnership with them, by giving them a percentage on all they can sell out of their gardens. In remarking to my salesman, who I know does his very best for me, on the poor rates I was getting for my Grapes, his reply was, "The market is glutted with the produce of the gardens of the nobility and gentry." I hope the public benefit by this excessive supply—no doubt they do; and we have no right to complain except on the ground that, as men solely dependent on our business as nurserymen and market gardeners, we should not be so heavily taxed, while dukes, lords, and ladies, who are in the same line of business, should all but escape scot free as far as taxation goes. There is another class of men, not rare, that have some business—it may be grocer or lime merchant—who, in instances known to me, grow and sell from 2000 lb. to 3000 lb. of Grapes annually; they are merely assessed on the rent of their house, and the Income-tax Commissioners know if they make any return to the income-tax for their Grapes. These are hardships that a very hard-working industrious class of men have to combat, and the attention of the proper authorities cannot be called to them a day too soon. Whether it is legal or not to assess a nurseryman's hothouses, who lives by the sale of his produce, it cannot be right not to assess a duke's or lord's when he happens also to be a nurseryman or market gardener, as so many of them are now. I am anxious to have the opinions of some of your well informed correspondents on this subject. It is one I don't mean to let sleep. *A Market Gardener*. [A very important matter, which should be fairly and temperately discussed. Eds.]

**Carnation Souvenir de la Malmaison.**—It may interest you to hear that I have a flower of the Souvenir de la Malmaison Carnation, measuring 4½ inches in diameter. Is this an unusual size? It looks as if it was a double flower—one inside the other, but the flower is perfectly formed and round. *J. Arthur Wallington, Manor House, Keevil*.

**Daffodils.**—In your report of my lecture two clerical errors occur, and for these I hold myself responsible. They will not trouble the reader who brings to the subject a glimmering of knowledge and a grain of charity, but they may as well be corrected. In the remarks on the Poet's Narciss I appear to have said, "Whall shall we say of bicolor, which has two flowers and a yellow centre?" As a matter of course biflorus is intended, and I am to be understood as ranging it as a variety under *N. poeticus*. In the forecast of the work of the student I suggest that in a thousand years all the difficulties will be cleared up, but the rate of correction assumed will necessitate a term of 100,000 years. [Will it be cleared up then? Eds.] *Shirley Hibbert*.

**Ouvirandra fenestralis.**—Having been fairly successful in the culture of this most interesting aquatic, the *Ouvirandra fenestralis*, I gladly accede to "Urania's" request (p. 458 of the *Gardeners' Chronicle*) by jotting down a few notes as to the method which we employ, in the hope that some supposed difficulties may be cleared away. First of all, we have tanks or tubs made of Oak, 3 to 3½ feet in diameter by 1 to 2 feet in depth. They are placed in a lean-to stove with a south aspect, the bottoms of the tubs resting on the pipes which heat the house, while the upper rim is within a foot from the glass. A lead pipe for conducting water is attached to each tub, by which they are filled. The plants are all either in pots or flats, any size desired, from thumb-pots upwards—in fact, as large as the tanks will hold. The soil used for potting is fibrous loam, rather rough, with a good sprinkling of silver-sand. We have tried different kinds of soil with nearly equal results, so that there is little in the soil used to cause failure in growing it. They are potted up to within an inch of the rim of the pots with the compost, filling in the remainder with clean gravel, small pieces of marble, or anything to keep the soil from being washed about. They are next placed in the water, raising them on inverted pots to suit the different sizes of plants—always keeping the crowns at least 2 inches beneath the surface of the water. Rain-water, if it can be had clean, is decidedly the best,

Any water fit for domestic use will do quite well. The temperature of the water ranges from 65° to 75°; but we have seen it thriving amazingly in much lower temperatures than this. The water should be frequently changed, at least once in the month. What we consider to be the main cause of failure is allowing the water to become almost stagnant—a condition conducive to the growth of confervæ, whereas it ought to be thoroughly aerated. Keeping the plants clean from confervæ is the greatest difficulty with which we have to contend. To effect this we have adopted various means, the best being to change the whole of the water once a week for a time whenever confervoid growth appears. This we do by removing the plants into a spare tank, running off the water, and scrubbing the insides of the tubs, making them thoroughly clean, then filling them up with fresh water, and allowing it to stand for a day before putting the plants back again. The plants are also cleaned by syringing them well in the spare tank; but as this mode takes up a considerable amount of time, we are obliged to resort to other means. Instead of removing the plants and changing all the water, we draw off with a siphon two or three panfuls only, using the syringe freely, which not only

it has: that the wild character of the scenery and ground is preserved, notwithstanding the beds of artificially raised flowers with which it is covered. The ground is admirably suited to its purpose. A wild and shelving hill, surrounded by forests thinned with great skill, the distant woods beyond, afford the means of making a series of terraces, all sheltered from the northern blast. The flowers seem almost as if Nature had in her prodigality planted them to form masses of colour in their own way, and if a rare plant is there it seems as if it were so by accident. I do not enter into details—I only give the impression the garden gives. It is the right direction which gardening should pursue if the general aspect of Nature is to be preserved. The art of the gardener should be, not to force Nature into unusual forms, but to control and embellish what Nature suggests. *Brinsley Marlay*.

**New Torenias.**—Last year I was much struck with a new *Torenia* which I saw, sent out I believe by Mr. Thomson, of Ipswich, the flowers and foliage of which greatly resemble those of the old well-known *T. asiatica* that used at one time to be such a great favourite for growing as a basket plant—a purpose

FIG. 95.—FRITILLARIA THUNBERGII. (SEE P. 533.)

clears off any loose confervæ, but also aerates the water. We then fill up the tubs with fresh water, flushing it over the edges. Another way of getting rid of confervæ, which we occasionally adopt, is that of excluding the light by covering the tubs with a board or lid, leaving it on for a week or two, when the confervæ will be found whitened, and can then be easily syringed off. When the plants are clean, all that we do with them is to syringe slightly once a day, running in a little fresh water to fill up the tubs. As to the mode of increasing this plant by division of the root, the warning given by the writer of the otherwise excellent cultural remarks in your last number is quite unnecessary, as we have taken off hundreds of plants in this way, and have never yet seen one piece fail to grow at any time; and so far from any injury being done to the stock plants by this process, we rather think it improves them. The conclusion we have arrived at, after lengthened observation, is, that had we a constant stream of moderately warm water running through our tanks, we should hear of less failures in growing this beautiful aquatic; and the nearer we can approach to this condition the better will be the results. *R. L.*

**Spring Gardening at Belvoir.**—Your correspondent, in his description of the spring garden at Belvoir Castle, does not bring out sufficiently what is its most striking feature. Now this is the natural air

its gracefully pendulous habit rendered it particularly suited for; and it is surprising that such a useful, showy subject should have gone so much out of cultivation. This may be partly owing to the great heat it required, as it could only be grown in a stove; but *T. Fournieri*—the one alluded to above—has the merit of being sufficiently hardy to endure the temperature of a greenhouse or conservatory during the summer, added to which it is so exceedingly floriferous that even very small plants of it come crowded with blossoms. Instead of being of a trailing nature, like its congeners already named, the habit of *T. Fournieri* is very compact and bushy, and the shoots just sufficiently stiff, if grown with proper light, to stand without any support. I tried to save the plant I had during the winter, but failed, and I infer therefore that it is an annual; and as it may be so easily raised from seed, and attains to the flowering size so quickly, any one by getting a packet now, and sowing in light soil, may soon have plants that will be of great service for the embellishment of rooms and other decorative uses, and it is even said that it is sufficiently hardy for bedding. Should it turn out to be so, it will be an acquisition and quite a fresh feature in gardens, where its colour will blend well with variegated *Pelargoniums*, and take the place of *Violas*, *Verbenas*, &c., that are so fugacious in hot summers—weather that would suit this *Torenia* exactly. To induce the seed to germinate freely, it requires the

assistance of a little warmth, such as may be afforded by a Cucumber frame, in which the young plants, too, grow with great freedom. The points of the shoots of these strike readily, so that a stock may soon be worked up; but as seed it is not expensive, it is hardly worth resorting to that mode of propagation. Peaty soil, or such as contains plenty of leaf-mould and sand, appears to suit best to grow it in, and for single plants 6 or 7 inch-pots are quite large enough to use for the final shift, as with plenty of water greater root-room than they afford is not required. *T. Bailloni* is another fine species, having bright golden-yellow flowers, which show up in pleasing contrast with the fine blue of the other. The treatment this needs is much the same as that requisite for *T. Fournieri*, both of which I hope to try outdoors this season, and report results. J. S.

**Vines Failing.**—A singular instance of failure in young Vines has recently come under my notice. They were planted three years ago in a border of

of them has long ago won his spurs in the horticultural world, and in fact is a noted grower of good Grapes, having taken leading honours at both local and international exhibitions on several occasions. Traces of wireworm have been seen in the border, but not to any extent; woodlice are also very numerous. On examining the roots they seem healthy. I should feel very much obliged if you would publish this letter, with the view of eliciting information. *Visitor*.

### FRITILLARIES.

Two *Fritillaries* have lately been shown before the Royal Horticultural Society, which demand some comment at our hands. The first (fig. 95), which is the *F. Thunbergii* of Miquel,\* is a Japanese species remarkable for its long, narrow, linear leaves, terminating in a tendril, and for its small bell-shaped flowers, greenish and mottled with pale purple

FIG. 96.—THE YELLOW FRITILLARIA, *F. MOGGRIDGEI*.

what to all appearance was good turf with some broken bones and charcoal; the first year they made very satisfactory growth, reaching the top of a lean-to house, 16 feet wide and the same in height. Last year they were cut down to within 3 feet of the ground. The grower being anxious to obtain a few bunches from each, they were started in the beginning of February, broke all right, but soon took on a "hard, dry" look, producing small foliage, and short stunted looking growths. Yellow spots by-and-by began to appear on the leaves, and their whole appearance was that of premature ripening; the bunches gradually began to dry up, and got as hard as a piece of wire, and before blooming time scarcely a trace of buds was to be seen. I enclose some bunches from these Vines this year, which are, as you will see, useless, but what the cause is is quite a mystery; they have exactly the same stunted dried-up look about them as last year. A few supernumerary Vines were planted in the middle of the border last year; they grew well, and this year showed plenty of fruit but now all seem to be going in the way indicated. Were these Vines under the care of a novice I should say there was something radically wrong in their management, but the unfortunate grower

(fig. 96). It is an interesting species, referred as a variety to *F. verticillata* by Mr. Baker. The last named is native to the Altai Mountains, and differs in having a style as long as the ovary, whereas in the variety the style is nearly twice as long as the ovary. The plant was shown by Messrs. Veitch.

*F. Moggridgei* is, according to Mr. Baker, merely a dwarf, broad-leaved, yellow-flowered form of *F. delphinensis* (which is purple-flowered), and native of the maritime Alps. As shown by Messrs. Backhouse, of York, recently, it appears to be a dwarf species, with rather large, cylindrical-bell-shaped, yellow flowers. It is a specially desirable species to grow, from its distinct character and handsome appearance.

\* *F. Thunbergii*, Miquel; *Uvularia cirrosa* Thunberg, Kunth; *Fritillaria collicola*, Hance, *vide* Baker; *F. verticillata* var. *Thunbergii*, Baker, in Journ. Linn. Soc. xiv., 258.

† *F. Moggridgei*, Boiss., in Moggridge, Cont. Fl. Mentone, t. 25; Planchon, Bull. Bot. Soc. France, 1873, 116; *F. delphinensis* var. *Moggridgei*, Baker, in Journ. Linn. Soc. xiv., 255.

### Reports of Societies.

**National Auricula (Southern Section):**  
*April 20.*—The members of the Southern section of the National Auricula Society are to be congratulated on the success of the second exhibition which they have held in the Royal Horticultural Society's large conservatory; for the display brought together on Tuesday was certainly the largest and most complete that has yet been made, and it drew a larger number of paying visitors than have before attended the gardens on any of the show days held this season. An agreeable sign of rising prosperity in connection with the Auricula Society, was the increased number of competitors—not a large number, it is true, but of a stamp that augurs well for the future. A greater number of plants have not in our recollection been brought together in the South, but as a result of the ungenial character of the past autumn and winter the quality of the flowers was not so fine as last year. The plants made a good growth early in the autumn, which, however, they failed to thoroughly mature, and as a consequence when the severe frost came they lost more foliage, or "grass," as it is technically termed, than is conducive to a good spring bloom. Many of the choicer varieties, such as Headly's George Lightbody, have not flowered at all kindly, while many of the selfs, which are naturally of a lighter substance than edged flowers, came even flimsier than usual, and of a most disappointingly fugitive character, in fact becoming as flat as ditch-water in a couple of days. As a consequence of all this many varieties got into the winning stands that last year, and indeed in all ordinary good seasons, fail to get shown at all in the small competing classes. The Northern florists were more strongly represented than they have ever been at the Southern shows, and as usual held their own in the various contests into which they entered. The Rev. F. D. Horner again had the honour of showing the champion flower, which on this occasion was Champion as well by name, a neat truss of six pips of Page's fine flower being singled out for that honour. Mr. Horner was also 1st for twelve, and very successful in other classes; as were also Mr. Ben. Simonite, Mr. Barlow, Mr. Pohlman, of Halifax, and Mr. Mellor, of Ashton-under-Lyne, while the Southern growers had able representatives in Mr. Douglas, Mr. Turner, and Mr. J. T. D. Llewelyn. The seedling classes brought out quite a bevy of first-rate flowers, upon which Mr. Douglas has promised shortly to bring his experienced judgment to bear. Polyanthus were more numerous represented than usual, and Mr. Barlow carried all before him, besides showing in a seedling named Sunrise one of the most perfect light body coloured flowers that has ever been shown. The following is the list of the prizes awarded:—

Twelve Auriculas, dissimilar.—1st, Rev. F. D. Horner, Kirkby Malzeard, Ripon, with Erebus (Horner), a seedling black self; Cecil Dalton (Horner), a grey-edged seedling; C. J. Perry (Turner); John Simonite (Walker), Freedom (Booth), Anna (Traill), Frank Simonite (Simonite), Heroine (Horner), a fine seedling plum-coloured self; Excelsior (Horner), a seedling grey-edged; Czar (Read), grey-edged; Lady Blucher (Clegg); and Ajax (Horner), a seedling grey-edged. 2d, Mr. James Douglas, gr. to F. Whitburn, Esq., Loxford Hall, Ilford, with John Waterston (Cunningham), C. J. Perry (Turner), Admiral Napier (Campbell), Lancashire Hero (Lancashire), Smiling Beauty (Heap), Alexander Meiklejohn (Kay), Green-edge (Campbell); True Briton (Hepworth), and four seedlings. 3d, Mr. B. Simonite, Rough Bank, Sheffield, with R. Gorton (Simonite), green-edged; Frank Simonite, Tahisman, Alex. Meiklejohn (Kay), Mrs. Douglas (Simonite), a lovely pale plum-coloured self; Lancashire Hero (Lancashire), Col. Taylor (Leigh), C. J. Perry (Turner), and four seedlings.

Six Auriculas, dissimilar.—1st, the Rev. F. D. Horner, with Complete (Sykes), Lancashire Hero (Lancashire), Frank Simonite (Simonite), Ringdove (Horner), Ajax (Horner), and Colonel Taylor (Leigh). 2d, Mr. R. Dean, Ranelagh Road, Ealing, with Richard Headly (Lightbody), Earl Grosvenor (Lee), Lord of Lorne (Campbell), Sophia (Chapman), Mrs. Smith (Smith), and Lancashire Hero (Lancashire). 3d, Samuel Barlow, Esq., Stakehill House, Chadderton, Manchester, with C. J. Perry (Turner), Lovely Ann (Oliver), Glory (Taylor), George Lightbody (Headly), Colonel Taylor (Leigh), and Beauty (Traill). 4th, Mr. E. Pohlman, Halifax, with New Green (Headly), Mazzini, a seedling black self; Acme (Read), John Waterston (Cunningham), John Crossley, a seedling green-edge; and Brilliant, a dark plum-coloured seedling self. 5th, Mr. T. Mellor, Ashton-under-Lyne. 6th, J. T. D. Llewelyn, Esq., Penlegare, Swansea. Mr. James Douglas and Mr. Simonite also competed.

Four Auriculas, dissimilar.—1st, Mr. E. Pohlman, with the seedling Mazzini, George Lightbody (Headly), Venus (Wright), and New Green (Headly). 2d, the Rev. F. D. Horner, with Sapphire (Horner), a seedling violet-purple self; John Simonite (Walker), Phantom (Horner), a seedling grey-edge; and Lancashire Hero. 3d, J. T. D. Llewelyn, Esq., with Apollo (Hudson), Richard Headly (Lightbody), Geo. Lightbody (Headly), and Ne Plus Ultra (Fletcher). 4th, Mr. T. Mellor,

with Complete (Sykes), a seedling grey-edge, a seedling green-edge, and a seedling dark maroon self. 5th, Mr. J. Douglas, with Smiling Beauty (Heap), Alexander Meiklejohn (Kay), Metropolitan (Spalding), and a seedling green-edge. 6th, Sam. Barlow, Esq., with Lancashire Hero, Anna (Traill), Beauty (Traill), and King Coffee (Horner), a self, well named.

Two Auriculas, dissimilar.—1st, Mr. E. Pohlman, with Imperator (Litton), and Lancashire Hero. 2d, the Rev. F. D. Horner, with Lancashire Hero and Thetis (Horner), a seedling grey-edge. 3d, Mr. Ben Simonite, with Frank Simonite, and a seedling green-edge of his own raising. 4th, Mr. T. Mellor, with Richard Heady (Lightbody) and C. J. Perry (Turner). 5th, S. Barlow, Esq., with C. J. Perry and Robert Traill (Lightbody). 6th, Mr. R. Dean, with Sophia (Chapman) and Royal Purple (Heady).

Two Auriculas, dissimilar (open to exhibitors not competing in the four previous classes).—The only exhibitor in this class was the Rev. E. L. Fellows, Wimpole Rectory, Royston, who was awarded the 1st prize for Robert Traill (Lightbody), and Topsy (Kay).

One green-edged Auricula.—1st, the Rev. F. D. Horner, with Page's Champion; 2d, Rev. F. D. Horner, with Cyclops, a seedling; 3d, Mr. R. Dean, with Rob Roy (Smith); 4th, Rev. F. D. Horner, with Orion, a seedling; 5th, Mr. B. Simonite, with Richard Gorton (Simonite); 6th, Rev. F. D. Horner, with Col. Taylor (Leigh); 7th, S. Barlow, Esq., with Col. Taylor; and 8th, Mr. T. Mellor, with Lord Palmerston (Campbell).

One grey-edge Auricula.—1st, the Rev. F. D. Horner, with George Lightbody (Heady); 2d, Mr. Pohlman, with Alderman C. E. Brown (Heady); 3d, Mr. R. Dean, with Rev. F. Tynons (Dean), a seedling; 4th, Mr. Douglas, with George Lightbody; 5th, — Kyrle Penson, Esq., with George Lightbody; 6th, Mr. Douglas with Richard Heady; and the Rev. F. D. Horner, 7th and 8th, with Lancashire Hero.

One white-edged Auricula.—1st, J. T. D. Llewellyn, Esq., with Catherina (Summerscales); 2d, Rev. F. D. Horner, with John Simonite (Walker); 3d, Mr. Douglas, with Silvia (Douglas); 4th, Mr. B. Simonite, with Frank Simonite; 5th, Mr. R. Dean, with Mrs. Campbell (Cunningham); 6th, Mr. B. Simonite, with True Briton (Hepworth); 7th, Mr. E. Pohlman, with Sophia Dumarsque; and 8th, Rev. F. D. Horner, with Smiling Beauty (Heap).

One self Auricula.—1st and 3d, Mr. Pohlman, with Blackbird (Spalding); 2d, S. Barlow, Esq., with the same variety; 4th and 5th, Rev. F. D. Horner, with seedlings raised by Mr. B. Simonite; 6th, Mr. Pohlman, with Mazzini; 7th, the Rev. E. L. Fellows, with Master Hole (Turner); and 8th, Mr. Pohlman, with Topsy (Kay).

Fifty Auriculas.—1st, Mr. James Douglas, with a capital group, which included no alpine, but in which many of the previously named varieties were to be found, as well as such sorts as Confidence (Campbell), Ellen Lancaster (Pohlman), Colonel Champneys (Turner), Alma (Lightbody), Lady Sale (Smith), Lord Clyde (Lightbody), Silvia (Douglas), and a few seedlings. J. T. D. Llewellyn, Esq., with amongst others already named, Ringleader (Kenyon), grey-edged; Earl of Errol (Dickson), Meteor Flag (Lightbody), Green Hero (Yates Morris), Queen of Greens (Heady), Lycurgus (Smith), Mr. Sturrock (Martin), and Prince of Greens (Traill). 3d, Mr. Charles Turner, Slough, with a neat lot, which included specimens in duplicate of such varieties, raised by himself, as C. J. Perry, Colonel Champneys, James Douglas, Clipper, Rupert, John Fowle, and Sarah, also Pizarro (Campbell), Eliza (Sims), and Vulcan (Sims).

Twelve alpine Auriculas, dissimilar.—1st, Mr. Turner, with a well-flowered lot, all of his own raising, and consisting of Colonel Scott, Mrs. Dodwell, Napoleon III., Miss Froud, Unique, Evening Star, Dr. Denny, Mrs. Llewellyn, James Fowle, Queen Victoria, King of the Belgians, and W. R. Bragg. 2d, J. T. D. Llewellyn, Esq., with Mrs. Llewellyn, Godfrey, Mrs. Dodwell, Lustre, Tenniel, Napoleon III., King of the Belgians, Evening Star, and Queen Victoria (Turner), Diadem (Gorton), and Mrs. Meiklejohn (Meiklejohn). 3d, Mr. J. Douglas, with Mrs. Llewellyn, Queen Victoria, and Slough Rival (Turner), Bismarck and Florence (Douglas), Diadem (Gorton), and six seedlings. 4th, Mr. R. Dean, with a selection from his new strain of laced varieties.

Six alpine Auriculas, dissimilar.—1st, Mr. Turner, with King of the Belgians, Sambo, Mrs. Dodwell, Mrs. Thompson, Mrs. Ball, and Shirley Hibberd. 2d, Mr. R. Dean, with Colonel Scott, Diadem, King of the Belgians, Satisfaction (Dean), Dazzle (Dean), and Mercury (Turner). 3d, J. T. D. Llewellyn, Esq., with Diadem, Lustre, John Leech, Percival, Elcho, and an unnamed. 4th, S. Barlow, Esq., with Ovid (Gorton), Etna (Turner), Elcho (Turner), Diadem, Beatrice (Turner), and Dazzle. 5th, Mr. Douglas.

Single specimen alpine Auricula.—Five out of the six prizes awarded in this class fell to the lot of Mr. Turner, who was 1st with Titian, 2d with Mrs. Ball, 3d with King of the Belgians, 5th with Unique, and 6th with Duchess of Connaught; Mr. Douglas being 4th with Meiklejohn's Mrs. Meiklejohn.

Seedling Auriculas.—Fourteen prizes were awarded for seedling Auriculas in the following order, those to which the letters F.C.C. are added being also awarded First-class Certificates:—Green-edge, 1st, Rev. F. D. Horner, with Cyclops (F.C.C.); 2d, Mr. R. Dean, with Smith's Rob Roy (F.C.C.); 3d, Rev. F. D. Horner, with Orion (F.C.C.). Grey-edge.—1st, Mr. R. Dean, with the Rev. F. Tynons (F.C.C.); 2d, J. T. D. Llewellyn, with an unnamed flower; 3d, the Rev. F. D. Horner, with Thetis (F.C.C.). White-edge.—1st, Mr. J. Douglas, with Conservative (F.C.C.); 2d, Mr. B. Simonite, with Mr. Dodwell (F.C.C.). Selfs.—1st, Rev. F. D. Horner, with Heroine (F.C.C.); 2d, Mr. B.

Simonite, with Mrs. Douglas (F.C.C.); 3d, Mr. T. Mellor, with Lord Salisbury (F.C.C.). Alpines.—1st, Mr. Turner, with Unique (F.C.C.); 2d, Mr. Turner, with Titian (F.C.C.); and 3d, Mr. Douglas, with Flora Douglas; all these belong to the gold-centred section.

Six dissimilar gold-laced Polyanthuses.—1st, S. Barlow, Esq., with Cheshire Favourite (Saunders), George IV. (Buck), Exile (Crownshaw), Lord Lincoln (Cox), Lancer (Bullock), and Sunrise (Barlow), a very pretty and exceedingly "correct" seedling, of a rich reddish chestnut body colour, and very pure lacing. 2d, Mr. James Douglas, with George IV., Cheshire Favourite, Lancer, Exile, President (Hilton), and Queen of Tyne (Craggie). 3d, J. T. D. Llewellyn, Esq., with Duke of Wellington (Smith), Cheshire Favourite, Mrs. Welby, Kingfisher (Addis), Exile, and George IV.

Three gold-laced Polyanthuses.—1st, S. Barlow, Esq., with President, George IV., and Exile. 2d, Mr. R. Dean, with Cheshire Favourite, President, and Exile. 3d, Mr. Douglas, with George IV., Cheshire Favourite, and Lancer. 4th, J. T. D. Llewellyn, Esq., with Formosa (Burnard), Exile, and F. D. Horner (Jackson).

For twelve dissimilar fancy Auriculas S. Barlow, Esq., took the 1st prize with the only group shown; and the 1st prizes for twelve each of dissimilar fancy Polyanthuses and double and single Primroses were awarded to Mr. R. Dean. In the class for the best plant of Smith's Duke of Wellington Polyanthus only one prize was awarded, viz., the 1st, to Mr. Douglas.

Twelve hardy Primulas.—1st, Mr. Douglas, with P. cashmiriana, P. sikkimensis, P. denticulata, P. farinosa alba, and the varieties corulea alba, flaccina, laciniata alba, and Pink Beauty of P. cortusoides amœna. 2d, J. T. D. Llewellyn, Esq., with three varieties of P. cortusoides amœna, P. denticulata erosa, P. japonica, P. cashmiriana, P. Monroi, P. cortusoides, and P. viscidula.

In addition to the large display of Auriculas, the exhibition also included a good assortment of subjects of a miscellaneous character, kindly sent by various nurserymen. Perhaps the most important of these was a magnificent group of Clematises, varieties of Azalea mollis, and various forms of Japanese Acers from the nurseries of Messrs. James Veitch & Sons; a large group of flowering and fine-foliaged plants from Mr. B. S. Williams; a group of decorative plants from Mr. Aldous; another one of stove and greenhouse plants from Messrs. Osborn & Sons; a large collection of cut Daffodils from Messrs. Barr & Sugden; a grand group of twenty Tea Roses in pots from Messrs. Paul & Son, Cheshunt, which was awarded a 1st prize by the Royal Horticultural Society, and which included well-grown and splendidly bloomed specimens of Souvenir d'un Ami, Madame Willemoz, Jean Ducher, Marie Van Houtte, Madame de St. Joseph, Anna Olivier, Madame Margottin, Catherine Mermet, &c. Mr. Parker, of Tooting, showed a large and superbly-flowered bush of Rhododendron Countess of Haddington Improved, a marked improvement on the type, in the form of its flowers, which are also more heavily shaded with rose. From Messrs. Hugh Low & Co. came flowering plants of Odontoglossum Roezlii superbum, and the creamy-yellow flowered Dendrobium heterocarpum; Messrs. Standish & Co., of Ascot, a splendid stand of three dozen cut blooms of Gardemia intermedia, some of which measured as much as 4 inches in diameter; and Messrs. Hooper & Co., of Covent Garden, had a choice group of stove and greenhouse plants. Mr. Cannell sent fine masses of Pansies, Polyanthuses, and Auriculas, also a number of well-flowered specimens of Tropæolum tricolorum. A collection of Cactuses from Mr. Boller, and some fine stands of Pansies from Mr. H. Hooper, of Bath, also deserve notice.

**Scottish Horticultural Association.**—The ordinary monthly meeting of this Association was held on Tuesday evening, the 6th inst., in the hall, 5, St. Andrew Square, Edinburgh. The President, who was in the chair, in opening the fourth session, spoke of the prospects of gardeners as becoming more bright, and he trusted that better seasons were now in store for all. He then alluded to the adaptation of the electric light for growing and forcing plants, fruits, flowers, and vegetables. The want of sunshine was a great drawback in Scotland during the past year, and any invention that will make up for this deficiency must be considered one of the greatest inventions of the age. He next referred to the syllabus for the year, which was more than usually attractive, and augured well for a successful session.

Mr. John Sadler, Royal Botanic Gardens, made some observations on the recent Herbaria competition. He went on to notice the various specimens exhibited, and more particularly the prize collection. In making up a herbarium, one of the grand things was to make a selection of characteristic specimens. For instance, if you have a tree, you will take a sprig of it, but you must also take a flower and fruit by which it can be distinguished. In all the collections there were mistakes in nomenclature. The manner in which the drying process was best accomplished was then shown. After a few days the plants are dry. There are plants that one may try to dry and fail after two months, and the flower actually opens after six months. The best way to treat these is to put them in boiling water for five minutes, and afterwards dry them. The drying of plants, though a simple matter, was the thing in which many failed.

*Exhibits.*—Mr. Robertson Munro, Abercorn Nursery, received a Certificate for Primula ciliata var. Lindsayi, an improved seedling from purpurata, and

raised by Mr. Robert Lindsay, Royal Botanic Gardens; it has a strong and vigorous habit, with flowers double the size of its parent. Mr. Andrew Hunter, Newhailes Gardens, exhibited two scented Tropæolums in full flower, named Mrs. Shand. Messrs. B. H. Remmers & Co., Glasgow, exhibited a machine by which gardeners could make their own pots for bedding plants. The composition used is cow-dung and garden earth mixed in about equal proportions; they can either be air-dried or dried by artificial heat; in either way they are ready for using in twenty-four hours. The roots of the plants grow easily through the sides of the pots, therefore each plant remains in its own pot, which, when embedded in the soil, soon disintegrates, and thereby becomes a source of nourishment to the plant itself.

**Royal Botanic: April 21.**—This Society was fortunate in having as fine a day for its second as for its first spring show, and also in being able to show its visitors a very excellent display of plants, thanks more to the miscellaneous class than to the subjects specially invited for competition. In the large conservatory, which was again requisitioned for space, the General Horticultural Company (John Wills) Limited, Messrs. James Veitch & Sons, and Mr. B. S. Williams each exhibited large groups; that from the former consisting in the main of tastefully grouped fine-foliaged plants, such as Crotons and Dracenas, but including also a very attractive batch of Odontoglossum vexillarium, and two immense plants of Arthropodium giganteum, which bore twenty-three spikes of blossoms between them; the entire collection being margined in front with a broad band of Selaginella, the beauty and good taste of which was spoiled by some lettering done with flowers of Gardenias. Messrs. James Veitch & Sons' contribution consisted of an admirable group of standard and half-standard Roses in pots, flanked on either side with a rich display of Clematises and brightly coloured varieties of Azalea mollis, toned down with the beautiful foliage of various Japanese Acers. Plants, old and new, rare and common, yet all beautiful, formed the bulk of Mr. B. S. Williams' collection. In this part of the exhibition was also a small group of Orchids from the choice collection owned by F. A. Philbrick, Esq., Q.C., Avenue Road, Regent's Park (Mr. Heims, gr.); a large group of show and alpine Auriculas, from Mr. Turner; a dozen each of show varieties from Mr. Turner and Mr. Douglas, in competition, and decided to be of the order of merit in which we have written the exhibitors' names. Messrs. James Carter & Co. showed several nice varieties of bedding Pansies and Violas; and Mr. Henry Hooper, of Bath, contributed a large assortment of the fine Pansies that he grows and exhibits so well.

In the long corridor Messrs. James Veitch & Sons had another excellent group of plants, new and rare stove and greenhouse flowering and fine-foliaged subjects; and Mr. William Bull also contributed a collection of an equally admirable character. Messrs. Paul & Son, of Cheshunt, showed a remarkably good group of nine Roses in pots, for which they were awarded the 1st prize; as also a liberal contribution of well-flowered large and small plants to the general display. In all cases the foliage and flowers were all that could be desired, and especially so in the case of the specimens of Dupuy Jamin, Marquise de Castellane, Céline Forestier, Cheshunt Hybrid, Madame Victor Verdier, La France, Perfection de Montplaisir, Annie Laxton, and Anna Alexieff, which formed the primary group. For twelve stove and greenhouse plants, Messrs. B. Peed & Son, were 1st, and Mr. G. Wheeler 2d, the former showing amongst others a well-flowered plant of Tremandra verticillata, and a handsome half specimen of Erica elegans, &c. For half-a-dozen Azaleas, amateurs, Mr. G. Wheeler came in 1st, and Mr. Ratty, gr. to R. Thornton, Esq., The Hoo, Sydenham, 2d; while in the corresponding class for trade growers, Messrs. B. Peed & Son were 1st, and Mr. H. James, Norbury Nursery, Streatham, 2d. In a poor class of Cinerarias, Mr. G. Wiggins, gr. to H. Little, Esq., Hillingdon Place, Uxbridge, was 1st, and Mr. Ratty 3d; the first-named exhibitor also taking 1st prizes for six Amaryllis and nine Pelargoniums. Daffodils in great variety came from Messrs. Barr & Sugden; cut Roses of great merit from Mr. Walker, of Thame, and Messrs. Paul & Son; Gardenias from Messrs. Standish & Co.; and a dish of very fine President Strawberries from Mr. Walker.

#### NEW PLANTS CERTIFICATED.

A considerable number of new plants were submitted for adjudication, and the following Botanical Certificates were awarded:—To Mr. William Bull, for Rhododendron assamicum with glabrous lanceolate leaves, and white flowers about 2 inches in diameter; for Masdevallia Wallisii, one of the Chimæra group; for Juncus zebrinus, the banded Rush; for Drosera filiforme, an upright growing species with leaves from 3 to 4 inches long, and densely covered with glandular hairs; for Acacia sphaerocephala, a handsome

dark green leaved species, with its branches thrown out from the main stem at almost right angles, and having a pair of remarkable dark brown spines about 1½ inch in length at the junction of each leaf-stalk with the stem; for *Tillandsia musaica*; for *Maranta Kerchoviana*, a showy leaved plant, pea-green in colour, with regular dark blotches arranged in lines on either side of the midrib; and for *Sarracenia flava picta*. To the General Horticultural Company, for *Dracæna Thomsoni*, a large broad-leaved form, greenish-bronze, margined with crimson; for *Dracæna aurantiaca*, the long, linear, arching leaves of which are of a salmon-orange shade, changing to pale bronzy green with age; for *Dracæna Ernestii*, a neat habited, dwarf, and nicely coloured plant, of a fine stamp for table decoration; for *Croton Baroune* James Rothschild, the fine seedling raised by MM. Chantrier, of Mortefontaine, and which has long broad leaves of a rich bronzy-copper colour, with crimson veins; for a handsome specimen of the variegated leaved *Tillandsia tessellata*; and for *Adiantum Bausei* ×, the new Maidenhair, with drooping pinnæ, described at p. 456, vol. xiii. To Mr. B. S. Williams, for the fine *Choisya ternata*, *Maranta Kerchoviana*, *Adiantum Bausei*, and *Adiantum mundulum*, a pigmy form, described last year at p. 48, vol. xiii. To Messrs. James Veitch & Sons for *Alsophila tomentosa*, a new Tree Fern from Java, with handsome feathery-looking fronds; for *Polystichum tripterum*, a wiry habited Japanese species; and for *Cypripedium marmorophyllum* ×, a hybrid between *C. Hookeri* and *C. barbatum*, with handsomely marbled foliage, a dark bronze slipper, rose tinted pale bronze petals, and a pale striped upper sepal. To Mr. Shore, The Gardens, Henbury Hill, Bristol, for *Pteris serrulata Shorei*, a finely crested form, more pendulous in habit than any of the varieties of this type that we have seen. To Mr. Boller, for *Aloe myriostigma*, the large, fleshy, pendent leaves of which are irregularly striped with white; and to Messrs. Hugh Low & Co., Clapton, for *Odontoglossum Roezlii superbum*, a very fine variety, with rich purplish-crimson blotches at the base of the upper pair of sepals and a large yellow blotch at the base of the lip. Floral Certificates were awarded to Mr. B. S. Williams for *Amaryllis Mrs. Burroughs*, a bright crimson-scarlet, margined with white and a light centre. To Mr. Howard, Southgate, for the showy yellow *Chrysanthemum frutescens Etoile d'Or*. To H. Little, Esq., for *Amaryllis Princess Dagmar*, a bright scarlet, with a white centre; and to Mr. Turner for *Auricula Mrs. Ball*, a golden-centred shaded alpine.

**Edinburgh Botanical: April 8.**—The Society met at 5, St. Andrew's Square, Dr. W. Craig, Vice-President, in the chair. The following communications were made:—

I. Note on the Flora of Colonsay, and list of Plants Collected July, 1879. By Mr. Symington Grieve. In the catalogue were upwards of twenty-one new plants hitherto unmentioned in this section of Mr. H. C. Watson's botanical geographical areas.

II. Note on some New Zealand Plants recently presented to the University Herbarium by Mr. J. F. Cheeseman, of the Museum, Auckland, New Zealand. By Mr. Taylor. This large collection includes beautiful typical specimens of *Haastia*, *Raoulia*, and other endemic New Zealand Composite.

III. Dr. Cleghorn exhibited twigs of *Aristotelia (Friesia) racemosa*, raised by Mr. Martin, gr. at Wester Lea, Edinburgh, from a seed accidentally deposited in the stem of a New Zealand *Dicksonia*, where it germinated three years ago between the fronds about 2 feet from the ground. The seedling was transferred to a pot, and is now in a greenhouse. It has not flowered, but is a robust plant 4½ feet high. This is a remarkable illustration of the spontaneous introduction of an exotic.

IV. Report on Temperatures and on the Progress of Open-Air Vegetation at the Royal Botanic Garden for March. By Mr. John Sadler, Curator.

V. Miscellaneous Communication.

**The Past Winter in Arran.**—In the light of the frequent advocacy of our western coasts as suitable localities for the extensive growth of Australasian trees and shrubs, the following observations, communicated by the Rev. D. Landsborough, of Kilmarnock, may not be uninteresting. Arran, it is well known, is not subject to the extreme falls of temperature so deadly to plant life on our eastern coasts. Accordingly, Australian and New Zealand genera, supposed to be aliens to our usual British climate, grow freely in it. Mr. Landsborough reported, regarding plants grown in the Cromla garden, near Corrie: One of the Blue Gums—the most hardy of which in Arran is the *Eucalyptus pendula*—hardly touched last winter, is sadly injured by this. Two other kinds of Gum-tree, raised from seed obtained from the Blue Mountains, New South Wales, have been planted. The very beautiful New Zealand Fern, *Todea hymenophylloides*, has proved quite hardy, though not under the spray of a waterfall, as was thought necessary for the full development of *Todea superba*.

The *Todea hymenophylloides* was planted only last summer, but grew at once, and the fronds of the mature plant promise to attain perhaps to the size of those of *Lastrea Filix-femina*. The fronds now are almost as green as during summer. The *Cordylines*, *C. indivisa*, *C. australis*, and *C. Veitchii*, are all untouched by the frost; so, too, are *Photinia serrulata*, *Desfontainea spinosa*, *Edwardsia grandiflora*, *Eleagnus japonica variegata*. A fine plant of the old single red *Camellia* planted last year was also untouched, and was in flower all last month (twenty-five blooms), the flowers in perfect order. A Cork tree—*Quercus suber*—and a plant which Mr. Landsborough takes to be *Cunninghamia sinensis*, both growing for the last twenty years at Brodick Castle, are both uninjured by this winter's frost.

The following plants were on the table in bloom from the forcing department of the Royal Botanic Garden:—*Anigostonthus breviflorus*, raised from seed sent by Surgeon-Major Fleming from Natal, where this *Amaryllidaceous* plant proved poisonous to horses of Her Majesty's troops; an *Iberis* from mountains above Crasse, obtained from G. Maw, Esq.; an *Erythronium Nuttallianum*; and a new variety of seedling from *Primula ciliata*, which it is proposed to designate *P. ciliata* var. *Balfouriana*.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 23, 1880.

MONTH AND DAY.	BAROMETER		TEMPERATURE OF THE AIR.				HYGROMETRICAL DEDUCTIONS from Glaisher's Tables 6th Edition.		WIND.	RAINFALL.

- April 15.—Overcast, dull, with rain till 4 P.M. Fine at night. A cool day.
- 16.—A fine day, partially cloudy. Milder. Sky clear at night.
- 17.—A fine bright day. Warmer. Cloudy at night.
- 18.—A fine warm day, cloudy towards evening, very cloudy at night.
- 19.—A fine bright warm day. Overcast at night. Very dry.
- 20.—A fine bright day. Cloudless at night. Heavy rain in early morning, and a shower at 4 P.M.
- 21.—A fine day, cloudy at times. Cool. Strong wind.

**LONDON: Barometer.**—During the week ending Saturday, April 17, in the vicinity of London the reading of the barometer at the level of the sea decreased from 50.13 inches at the beginning of the week to 29.65 inches by the afternoon of the 14th; increased to 29.71 inches by the morning of the 15th; decreased to 29.65 inches by the afternoon of the same day; increased to 29.92 inches by the evening of the 16th; decreased to 29.85 inches by the afternoon of the 17th; and was 29.94 inches at the end of the week. The mean reading for the week at sea level was 29.83 inches, being 0.09 inch above that of the preceding week, and 0.08 inch below the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 63½° on the 17th, to 47° on the 14th; the mean value for the week was 54½°. The lowest temperatures of the air observed by night varied from 34° on the 12th, to 42° on the 14th; the mean value for the week was 38°. The mean daily range of temperature in the week was 16½°; the greatest range in the day being 25½°, on the 17th, and the least 5°, on the 14th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—April 11, 42°, -3°.8; 12th, 42°, -3°.9; 13th, 46°.9, +0°.8; 14th, 44°.3, -2°.0; 15th, 43°.8, -2°.7; 16th, 46°.5, -0°.1; 17th, 50°.2, +3°.4. The mean temperature of the air for the week was 45°.1, being 1°.2 below the average of sixty years' observations.

The highest readings of a thermometer with black-

ened bulb in vacuo, placed in the sun's rays, were above 120° on the 12th, 13th, 16th, and 17th, but on the 14th and 15th the readings did not rise above 55°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 29¾° on the 12th and 32° on the 13th and 17th; the mean of the seven lowest readings was 34½°.

**Wind.**—The direction of the wind was N.E., S.E., and S.W., and its strength moderately strong.

The weather during the week was generally showery, cool, and the sky cloudy. Friday and Saturday were the finest days.

Rain fell on five days; the amount measured was 1.05 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, April 17, the highest temperatures of the air observed by day were above 62½° at Blackheath, Leicester, Cambridge, and Hull, and below 54° at Wolverhampton, Bradford, and Leeds; the mean value from all stations was 59½°. The lowest temperatures of the air observed by night were below 34° at Blackheath, Leicester, Cambridge, Wolverhampton, Sheffield, Hull, and Bradford; and above 39½° at both Truro and Plymouth; the general mean from all places was 35½°. The extreme range of temperature in the week was above 30° at both Cambridge and Hull, and below 18° at Truro and Plymouth; the mean range of temperature from all stations was 24°.

The mean of the seven high day temperatures of the air was above 54° at Truro, Brighton, Blackheath, Cambridge, and Sunderland, and below 50° at Wolverhampton, Bradford and Leeds; the mean value from all places was 52°. The mean of the seven low night temperatures of the air was below 38° at Blackheath, Cambridge, Wolverhampton, Nottingham, Sheffield, and Hull, and above 42½° at both Truro and Plymouth; the mean value from all stations was 39½°. The mean daily range of temperature in the week was above 16½° at Blackheath and Cambridge, and below 10° at Plymouth and Liverpool; the mean daily range from all places was 12¾°.

The mean temperature of the air for the week from all stations was 44½°, being 6° higher than the value for the corresponding week in 1879. The mean temperature was above 46° at Truro and Brighton, and below 43° at Wolverhampton, Nottingham, Sheffield, Bradford, and Leeds.

**Rain.**—Rain fell on every day in the week at Bradford, and on four or five days at most other places. The heaviest falls were about 1 inch at both Blackheath and Bradford, and the least falls were 0.22 inch at Liverpool and 0.33 inch at Plymouth; the average fall over the country was 0.60 inch.

The weather during the week was very dull and showery at times, but generally fine.

**SCOTLAND: Temperature.**—During the week ending Saturday, April 17, the highest temperatures of the air observed by day varied from 60° at Edinburgh to 52° at Perth; the mean value from all places was 55½°. The lowest temperatures of the air observed by night varied from 33° at Perth to 36½° at Edinburgh; the general mean from all stations was 34¾°. The mean range of temperature in the week from all places was 20½°.

The mean temperature of the air for the week from all stations was 44°, being 5½° higher than the value for the corresponding week in 1879. The mean temperature of the air was above 44½° at Edinburgh and Leith, and below 43½° at Perth.

**Rain.**—The heaviest falls of rain were 0.93 inch at Edinburgh, and 0.90 inch at Leith and Perth; and the least falls were 0.33 inch at Glasgow and 0.38 inch at Paisley; the average fall over the country was 0.65 inch.

**DUBLIN.**—The highest temperature of the air was 51¾°, the lowest 33°, the extreme range was 18°, the mean 43½°, and the fall of rain 0.96 inch.

JAMES GLAISHER, F.R.S.

## Answers to Correspondents.

**ASPARAGUS BEDS: G. T.** You had better remake the beds and replant them at once. Dig out the heavy soil 18 inches deep, drain it well, making an outlet for the water, and make up again with soil in which a considerable proportion of gritty material has been mixed, raising it a foot above the general level. Growing plants are best to plant, but it must be done carefully.

**DENROBIIUM: J. Y. K. P.** The leaf looks as if it had suffered from too dry an atmosphere. It may possibly have been caught by bright sunshine while immature.

**DOUBLE CYCLAMEN: H. C. Wilmot.** The Cyclamen varies occasionally, with an abnormal number of segments, and yours is probably one of these cases. They are probably permanent, but so far as we have yet seen no improvement on the normal form.

**DOUBLE PRIMROSES: W. M.** The natural tendency would be that double-flowered plants left to their fate

would lose more or less of their doubleness for want of feeding, as very high culture might occasionally induce doubleness; but we do not believe they would, under any conditions, turn to hose-in-hose flowers, which are a distinct type into which the Primrose family has a tendency to vary.

**ERRATA.**—At p. 497, in my remarks on the York Nurseries, there is an error. I wrote "5° Fahr., or 37° of frost." That was the lowest temperature recorded at York last winter. *J. Douglas.*—In the article on Gardenias, at p. 489, for "dry heat," read "damp heat." *D. T. F.*—May I be permitted to state that in p. 500, the second line from the top, should be read, "When the first mowing begins," not "crowding;" and in the fourth line from the end of the subject, read "silvery grace," not "grass." *H. M. E.*

**EUCALYPTUS:** *J. Steele.* We believe the seeds are correctly named, but without further evidence it is impossible to be quite certain.

**INSECTS:** *C. H. W.* Your *Picea Nordmanniana* is attacked by one of the aphides, which we cannot determine as all the specimens (females) are dead, each having deposited a mass of small flesh-coloured eggs which will shortly hatch. Fumigation would destroy them whilst very young. *I. O. W.*

**NAMES OF PLANTS:** *T. F., Mill Hill.* 1, *Opuntia cylindrica*; 2, *Opuntia leucotricha*; 3, *Gasteria verrucosa*; 4, *Sparmannia africana*.—*W. P., Epping.* *Scilla natalensis.*—*J. J.* 1, *Narcissus incomparabilis*; 2, *N. incomparabilis aurantius*; 3 and 5, the double Florence Paffodil.—*N. Telemionis plenus* of Haworth; 4, *N. incomparabilis flore-pleno*; 6, the double form of the single white *N. incomparabilis* Peerless, commonly called the double Orange Phoenix; 7, *Luzula campestris* (the field Wood-rush).—*James Wilson.* *Eucalyptus globulus.*—*E. H. M. S.* *Atriplex halimus.*—*M. J., Annan.* 1, *Brassica Lanceana*, var.; 2, *Adiantum hispidulum*; 3, *Doodia caudata*; 4, *Asplenium bulbiferum*; 5, *Nephrodium decompositum*; 6, send again when more advanced. —*E. C.* *Cymbidium pendulum.*—*Inquirer.* *Cymbidium eburneum.* We should like to see a more ample specimen of the Passion-flower. It may be new.—*C. H. D.* *Chrysosplenium oppositifolium.*—*Rhodo.* *Rhododendron campanulatum.*—*D. P.* 1, *Cyanotis repens*; 2, *Doronicum caucasicum*; 3, *Phlox setacea*; 4, *Myosotis*, not recognisable; 5, *Corydalis*, not recognisable without the flowers; 6, *Isolepis gracilis.*—*Subscriber.* The largest flower is *Cattleya Skinneri*. Please send better specimens of the others, and number them. *C. R.* 1, *Davallia canariensis*; 2, *Asplenium bulbiferum*; 3, *Lantana* (leaves only); 4, *Cyanotis repens variegata*; 5, *Passiflora coerulea*. They are all very bad specimens.—*A. J. M.* *Dondia epipactis.*—*T. P. P.* *Anemone apennina*.

**PANSY:** *J. C.* Very like the variety sent out as Cliveden Yellow in its general character, but of a richer shade of yellow, and very much larger in the flowers, which are of equally good form and substance. It will no doubt make a very effective bedder.—*C. H.* Your seedling is a rich deep purple self, darker than Cliveden Purple, but as the flowers were collapsing, that is all we can say of it. The Orchid is *Bifrenaria Harrisonae*.

**PEACHES:** DISBUDDING, STOPPING, AND THINNING FRUIT: *J. S.* If you will refer to the Peach Calendar for the past or present year you will find complete answers to your questions. Disbudding should be performed piecemeal at intervals of a few days, and when finished the young growths should be about 6 inches apart after they are tied down. If the trees have not covered the trellis, allow all terminal shoots to grow to their full length, stopping only those which are likely to become too strong, and so destroy the balance of the tree. A shoot 12 inches in length should not carry more than one fine Peach to maturity. Mediocre Peaches are plentiful enough, but to have them as fine as they can be grown, say 8 oz. to 10 oz. each, one fruit to every square foot of trellis covered with foliage will be found a heavy crop when ripe, and quite as much as the trees can support from year to year. When Peaches have completed the first swelling they will be about the size of pigeons' eggs, but different kinds vary in size; they will then cease swelling for a period of nearly six weeks, and this is called the stoning period, during which the temperature should be kept as equitable as possible. When the last swelling for ripening sets in all shoots that will have to be cut out after the fruit is gathered may be stopped, to prevent over-crowding and to increase the size of the fruit. We do not approve of pinching in summer or shortening back in winter. The finest trees in Britain have been grown on the extension principle, the great secret being thorough ripening of the wood. *H. C.*

**POLYANTHUSES:** *S. F. & Co.* Neither of them are of any value as florists' flowers.

**ROOTS IN DRAIN:** *J. H. C.* We cannot identify the roots taken out of the drainpipes without better evidence than that you supply. You should search on the spot.

**TODEAS:** *Beginner.* The Todeas should be potted in well drained peaty soil, and set in a close frame either in a greenhouse or sheltered place outdoors, the plants being sprinkled once or twice daily. The Tree Ferns, if dormant, must not get any water in their crowns until they have started, but should stand in a house in which the atmosphere is moderately moist, and if large trunks they may be lightly sprinkled occasionally.

**VINES:** *J. T. S.* The rods or main branches of your Vines should be about 3½ feet apart. The shoots may

be stopped at one, two, or three joints beyond the bunches. The point is to leave them as long as possible without trespassing on each other, or crowding the leaves. You must bend the shoots gradually a little one day and again the next. They will bend easily in a little while, so do not be in too much hurry.

\* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. *Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

**CATALOGUES RECEIVED:**—Ellwanger & Barry (Monnt Hope Nurseries, Rochester, N.Y.), Catalogue of Ornamental Trees, Shrubs, Hardy Perennials, &c.—M. Bruant (Poitiers, Vienne, France), Catalogue of Florists' Flowers, Bedding Plants, &c.—Woolson & Co. (Passaic, N.J., U.S.A.), Descriptive Catalogue of North American Bulbs, Roots, &c., for 1880.—James Cocker & Sons (Aberdeen), General Spring Catalogue of Bedding and other Soft-wooded Plants.—Thomas S. Ware (Hale Farm Nurseries, Tottenham), Spring Catalogue of Hardy Florists' Flowers.—Robert Mack & Son (Catterick Bridge, Yorkshire), List of Choice Dahlias.—William Potten (Sissinghurst, Staplehurst), a Select List of Pelargonium and other Bedding Plants.—Louis de Smet (Ledeberg-lez-Gand, Belgium), Catalogue of Plants.—John Laing & Co. (Stanstead Park, Forest Hill, S.E.), Priced List of Tuberous-rooted Begonias.

**COMMUNICATIONS RECEIVED.**—E. W. B.—J. H. K.—D. C. P.—J. L.—J. V & Sons.—J. R. J.—J. W.—E. M. E.—S. J. C.—J. G.—F. R. S.—P. M.—H. L. & Co.—W. W. B.—Brazil.—T. S.—Messrs. Crossley Brothers.

**DIED,** on April 19, at 52, St. Paul's Road, Camden Square, N.W., MARY ANNE, widow of the Rev. JOSHUA DIX, Rector of Allhallows with St. John the Evangelist, Bread Street, E.C. (and for several years a member of the Council and chairman of the Floral Committee of the Royal Horticultural Society), and eldest daughter of the late Henry Boys, Esq., of Malmsbury, Wiltshire, Kent, in her 68th year.

## Markets.

COVENT GARDEN, April 22.

We are now feeling the effects of the fine spring, all sorts of house produce reaching us in as plentiful and as good condition as we have experienced for some years. With only a moderate demand, however, prices keep very low, Strawberries alone meeting with a brisker demand. Large quantities of Asparagus from France and Spain have arrived during the week, as also the first Gooseberries from the West of England. *James Webber, Wholesale Apple Market.*

### SEEDS.

LONDON: April 21.—The market to-day was moderately attended, and seeing that the season is now drawing to a close, there was a fair general consumptive demand. Values all round stand at the unusually low level previously described. Choice Canadian Clover seed in particular, being unprecedentedly cheap, continues in great favour. Alsike and Trefoil are now most reasonable. White Clover is steady. Timothy and Lucerne are rather scarce. Spring Tares find buyers on former terms. The sale for Mustard and Rape seed is slow. Of Sainfoin the supply appears exhausted. Buckwheat and Linseed are without change. Very low quotations prevail for bird seeds. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

### CORN.

Trade was extremely heavy at Mark Lane on Monday. English Wheat was 1s. to 2s., and foreign 2s. to 3s. per quarter cheaper than on Monday se'night. Barley was dull and cheaper to sell. The malting season is now over. Malt moved somewhat in favour of buyers. Oats were in limited request and the turn lower; while Maize suffered to the extent of another 6d. per quarter. Beans were steady. Peas met with a small demand and were slightly easier. Flour was decidedly flat, both sacks and barrels being a good 1s. cheaper.—On Wednesday English and foreign Wheat was quoted as on Monday. Barley met with a small inquiry, and as regards Oats, Maize, and other articles there was extremely little doing. No change was reported in prices, but the general tone of business remained flat. The weather continues most propitious for the crops, and accordingly the most sanguine anticipations are indulged in.—Average prices of corn for the week ending April 17:—Wheat, 47s. 11d.; Barley, 33s. 8d.; Oats, 24s. 6d. For the corresponding period last year:—Wheat, 41s. 2d.; Barley, 30s. 11d.; Oats, 20s. 7d.

### CATTLE.

At Copenhagen Fields on Monday trade in beasts was slow, and prices on the average not so good as last reported. Choice quality sheep met with a ready sale at higher rates. Good lambs and calves were scarce, and made higher prices. Quotations:—Beasts, 4s. 6d. to 5s. 2d., and 5s. 6d. to 6s.; calves, 5s. 6d. to 7s.; sheep, 5s. 4d. to 5s. 8d., and 6s. to 6s. 8d.; lambs, 8s. 6d. to 9s. 6d.; pigs, 4s. 6d. to 5s. 4d.—On Thursday, notwithstanding short supplies, trade was dull in tone, and presented a drooping tendency. Both beasts and sheep sold slowly at rather under Monday's prices. Lambs were decidedly weaker, but calves were fairly steady.

### HAY.

Tuesday's Whitechapel Market report states that there was a moderate supply of fodder, and trade was quiet at firm rates:—Prime Clover, 100s. to 132s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 105s.; inferior, 30s. to 70s.; and straw, 30s. to 35s. per load.—On Thursday there was a fair supply of hay and straw on offer. The trade was very dull at the above prices.

### POTATOS.

The Borough and Spitalfields Markets reports state that home-grown Potatos command a ready sale and full prices, but the trade seems dull as regards foreign, owing to extensive supplies. Scotch Regents, 140s. to 160s.; ditto Champions, 180s. to 200s.; Lincoln ditto, 180s. to 190s.; Victorias, 160s. to 180s. per ton; German reds, 4s. 6d. to 7s.; Duch rocks, 4s. 6d.; and French white, 4s. 6d. per bag.—During last week 74,616 bags of Potatos were received at London from Hamburg, 15,466 bags 16,039 sacks Stettin, 15,766 bags Danzig, 7003 Harburg, 2000 Bremen, 1038 Harlingen, and 2818 casks Colburg.

### COALS.

The following are the prices current at market during the week:—East Wylam, 15s. 6d.; West Hartley, 14s. 3d.; Walls End—Harton, 14s. 6d.; Hetton, 16s.; Hetton Lyons, 14s. 6d.; Lambton, 15s. 6d.; Original Hartlepool, 16s.; Wear, 14s. 6d.; Tunstall, 14s. 6d.; Chilton Tees, 15s. 6d.; Hawthorn, 14s. 9d.; South Hetton, 16s.; Tees, 15s. 9d.; Radford Navigation, 15s. 9d.

**Government Stock.**—The closing price of Consols on Monday was 98½ to 98½, for both delivery and the account. Tuesday's figures were, for delivery, 98½ to 98½, and 98½ to 98½ for the account. On Wednesday the closing prices were 98½ to 98½ for both delivery and the account, and on Thursday they were, for delivery, 98½ to 98½, and 98½ to 98½ for the account.

By Permission of the Hon. Board of Customs.  
(Free of Duty.)

# CORRY & SOPER'S NICOTINE SOAP (PATENT).

An effectual and speedy Eradicator of Scale, Thrips,  
Green Fly, Mealy Bug, Red Spider,  
American Blight,  
and all Parasites affecting Plants, without injury to  
Foliage.

It may be used with perfect safety and efficiency for the  
Destruction of Gooseberry Caterpillars.

Especially adapted for the Destruction of Blight on the  
Coffee Plant.

The Proprietors have great pleasure in bringing to the notice  
of Horticulturists generally this valuable preparation, the  
basis of which is *Nicotina*, or the Oil of Tobacco, with which  
is blended other essential ingredients, to render it available as a  
general INSECTICIDE.

It has now undergone a thorough test by some of the most  
practical men in Horticulture, and it is proved beyond all doubt  
that no Insecticide will bear comparison to it for killing prop-  
erties with **Perfect Safety to Foliage.**

It may be used as a Dip or Wash for any description of out-  
door or indoor Plants, and as a Dressing for the Bark of Fruit Trees,  
Vines, &c., it has no equal.

The following is a fair sample of Testimonials, selected from  
some hundreds lately received from men of considerable experi-  
ence:—

Messrs. J. & J. HAYES, *Nurserymen, Edmonton, London, N.,*  
on Feb. 9, 1880, write:—

"We consider your Nicotine Soap a great boon to all who  
have anything to do with plants or fruit growing, as it is so very  
useful for dipping and syringing when it is not convenient to  
fumigate. You are quite at liberty to make what use you  
please of this."

Messrs. OSBORN & SON, *The Fulham Nurseries, London,*  
write:—

"We have given your Nicotine Soap a fair trial, and our  
experience confirms the character you give it, that it is an  
unrivalled preparation for killing insect life, without injury to  
plants."

Mr. B. MALLER, *Brent Ash Nursery, Lee, London, S.E.,*  
on Feb. 21, 1880, writes:—

"I have given your Nicotine Soap a fair trial, and I must  
now say it is very satisfactory. I am now having it used freely  
for syringing,  $\frac{1}{2}$  pint to 4 gallons of water, without the least  
injury to the foliage."

Mr. J. C. SEYERS, *Orchid Grower to Sir Trevor Lawrence,*  
*Bt., Burford Lodge, Dorking on Nov. 24, 1879, writes:—*

"I have now tried in many ways your Nicotine Soap  
as an insecticide for Orchids, and it has given me great satisfac-  
tion," &c.

Messrs. BARNWELL & TILBURY, *Nurserymen, Worthing,*  
on March 19, 1880, write:—

"Having used Corry & Soper's Nicotine Soap this year, we  
can with pleasure say it is the most useful insecticide that has  
ever come under our notice. We have tried it on Strawberry  
plants when in bloom, and find it most effectual in destroying  
the fly, whilst it does not in the least injure the plants or  
flowers, but gives a better and healthier growth to the plants."

Mr. GEORGE ABBEY, *Gardener to C. M. Palmer, Esq., M.P.,*  
*Grenk's Park Garden, Saltburn-by-the-Sea, on February*  
*20, 1880, writes:—*

"The Nicotine Soap I had from you I find a safe and power-  
ful insecticide, being destructive of every kind of insect infesting  
plants, and in no instance has any injury been done to the  
foliage. At a strength of 3 oz. to a gallon of water, I have  
used it for syringing Peaches during growth for the destruction  
of red-spider, without injury in any way (only to the insect)—  
which it instantly kills). At that strength to 4 oz. to the gallon  
it may, with perfect safety, be employed for syringing every  
description of fruit tree, whether under glass or outdoors, and  
a majority of plants, without the least injury, whilst at the  
same time it destroys aphides—green, brown, blue, and black  
—thrips, and red-spider. At a strength of 6 to 8 oz. to a gallon  
of water, I have employed it very successfully for destroying  
mealy-bug, brown and white scale, both by syringing the  
plants and applying with a brush, its effects upon the insects  
making its application gratifying; whilst from its grateful  
smell, it is pleasant than otherwise. At a strength of 3 oz. to  
the gallon I found it a first-rate winter dressing for fruit trees,  
mealy-bug on Vines, as well as a destroyer and preventive of  
red-spider, thrips, and aphides. It also destroys American  
blight."

The following Nurserymen authorise us to say they have  
used the Nicotine Soap with unqualified satisfaction:—

J. Laing & Co., Forest Hill, London, S.E.; Hawkins &  
Benoett, Twickenham, S.W.; G. Edwards, Balham S.E.;  
James Walton, Lee, S.E.; D. S. Thomson, Wimbledon, Surrey;  
F. & A. Smith, Dulwich, S.E.; J. Peed & Son, Roupell Park,  
Lower Norwood, S.E.; G. Brand, Winchmore Hill, N.; Hooper  
& Co., Covent Garden, W.C.; Lucombe, Pince & Co., Exeter;  
Edwin Cooling, Derby; T. Frost & Sons, Maidstone; W. C.  
Drummond, Bath; G. & W. Yates, Manchester; W. Bryant,  
Rugby; J. Stewart & Son, Dundee; J. Cocker & Son, Aber-  
deen; J. Charlton, Tunbridge Wells; Edmonson Bros., Dame  
Street, Dublin, &c.

Sold in jars, 8 oz., price 1s. 6d.; 20 oz., price 3s.; and in  
tins, 14 lb., price 16s. 6d.; and drums, 28 lb., price 25s.;  
56 lb., price 60s.; 112 lb., 95s. Full directions for use on each  
package.

And 2 oz. sample jars, 6d. each.  
Full directions for use on each package.

Manufacturers of Tobacco Powder, Tobacco Juice (duty free),  
Tobacco Paper and Cloth, and Horticultural Sundriesmen.

May be obtained from all Seedsmen and Florists.

Wholesale from the Manufacturers,

**CORRY & SOPER,**  
BONDED TOBACCO STORES,  
SHAD THAMES, LONDON, S.E.

Is now recognised by practical men  
throughout the United Kingdom as  
the best Manure that has ever been  
manufactured.

This Manure is composed of  
*highly concentrated animal matter*,  
and is entirely different from Guano,  
Nitrate of Soda, and all Chemical  
Manures, which are merely stimu-  
lants, and in the end exhaust and  
deteriorate the soil. It is really a  
*Plant Food*, and all Crops appear  
to benefit in a most remarkable  
manner from its application. It is  
now being used most successfully

For all Farm Crops,  
For all Kitchen Garden  
Crops,  
For Lawns and Flower  
Gardens,  
For Vines and Strawberries,  
For Melons and Cucumbers,  
For all Soft-wooded Plants,  
For all Stove and Green-  
house Plants,  
For Camellias, Azaleas, and  
Gardenias.

Sold in Packets 1s. each, and in Bags,

$\frac{1}{4}$ Cwt.	$\frac{1}{2}$ Cwt.	1 Cwt.
7s. 6d.	12s. 6d.	20s.

SPECIAL QUOTATIONS BY THE TON.

LAWN MOWERS — LAWN MOWERS.

New and Improved Machines for 1880.

SAMUELSON & CO.'S

NEW

"VILLA" AND "FAVORITE" PATTERNS ARE THE BEST.

London Agents: HILL & SMITH, Queen Victoria Street. T. BRADFORD AND CO., Holborn (and all respectable Ironmongers in Town or Country). MANUFACTORY: BANBURY, OXON.

Hurry's Daisy and Weed Extractor, FOR LAWNS.

No one possessing a Lawn should be without this wonderfully useful little Invention.

(See the *Gardeners' Chronicle* of August 2, 1879.)

Directions for Use:—

The "Extractor" should be used as early in the year as possible, in the following manner:—Place the tool over crown of weed, and with a slight twist extract it. The plugs so raised discharge themselves (second pushing out first), and should be replaced UPSIDE DOWN while still fresh. The weed will die, and the grass grow better where this has been done. In using mowing machine after "Extractor" the box should be left off as much as possible, and the grass afterwards well rolled. If these instructions are carried out any lawn may be effectually freed from the obnoxious Plantain and Daisy roots which so often offend the eye. Lawn grass should always be kept short, to avoid the weed seeding.

To be obtained of all Ironmongers and Florists. Price 3s 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: THOMAS TILLEY, 12, Wallbrook, London, E.C. Cambridge Agents: G. BEALES & CO.

Or Carriage Free of the Inventor on receipt of P.O.O. for 4s. 3d. and 5s. 3d., payable at Cambridge or Sawston.

ALFRED F. O'C. HURRY, PATENTEE, PAMPESFORD, CAMBRIDGESHIRE.

Oil Paint No Longer Necessary. HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Piercefield Park, June 21, 1876.—Sirs,—I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H & S's Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c. sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

Rustic Garden Furniture in great variety.

Garden Seats, Awnings and Tents, Rustic Tables, Chairs, and Flower Stands, Lawn Mowers, Garden Rollers, Water Barrows, Wheelbarrows, Garden Tools, Summer Houses, Sun Dials, Fancy Wirework, Birdcages, Hammocks, and all kinds of Garden Furniture at lowest marked prices. Catalogues post-free.

ILLUSTRATED CATALOGUES CAN BE HAD ON APPLICATION.

**EMIGRATION TO THE NEW NORTH-WEST.**—The Northern Pacific Railroad Company opens for settlement a vast region of fertile land in the North-West of the United States, and provides the best route to the prairie country of Canada. The Company has for Sale 6,000,000 acres in Minnesota and Dakota, at very low rates for cash—say 10s. or 12s. per acre—with liberal terms of credit, though slightly higher prices, to actual settlers. The latter may obtain equally good Government Lands, without money, under generous provisions of American Law. The great Wheat Farms of the Red River Valley are within the Company's limits, and the progress recently made in farming on its line in Dakota has no parallel. The extension of the road to the Yellowstone, during the coming Autumn, will bring within easy reach the varied resources of Montana, its Gold and Silver Mines, its Arable Lands, and its Grazing Areas, where cattle are reared and fed at the mere cost of herding. Parties proceeding to Manitoba *via* Duluth, or *via* St. Paul and Brainerd, pass over part of the road, and are afforded special facilities for the examination of its lands. Call at or address the Northern Pacific Railroad Agency, 20, Water Street, Liverpool.

**CALIFORNIA AND COLONISATION.**—FULL ACCOUNTS OF THE WONDERFUL RESOURCES, Facilities for Settlement, and Healthiness of this NOBLE STATE, with Particulars of the Washington Irrigation Colony in Fresno County, will be forwarded to intending Emigrants on application to

JOHN B. ADAMS, General Agent.  
57, King William Street, City, London.

**Loss of Time is Loss of Money.**—Accidents cause Loss of Time, and may be provided against by a Policy of the **RAILWAY PASSENGERS ASSURANCE COMPANY.**—The Oldest and Largest Accidental Assurance Company. Right Hon. Lord Kinnaird, Chairman. Subscribed Capital, £1,000,000. Moderate Premiums. Bonus allowed to Insurers of five years' standing. A fixed sum in case of Death by Accident, and a Weekly Allowance in the event of Injury. One Million and a Half has been paid as compensation. Apply to the Clerks at the Railway Stations, the Local Agents, or 64, Cornhill, London, E.C.

WILLIAM J. VIAN, Secretary.

**BELGIAN.**

**KINAHAN'S LL WHISKY.**  
Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*

**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**  
**JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA.**  
**THE BLOOD PURIFIER.**  
This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—131, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S PILLS.**—The greatest wonder of modern times—They correct Bile, prevent Flatulency, cleanse the Liver, and purify the System, renovate the Debilitated, strengthen the Stomach, increase the Appetite, invigorate the Nerves, promote Health, and reinstate the weak to an ardour of feeling never before expected. The sale of these Pills throughout the globe astonishes everybody, convincing the most sceptical that there is no medicine equal to Holloway's Pills for removing the complaints which are incidental to the human race. They are indeed a blessing to the afflicted, and a boon to those who suffer from any disorder, internal or external. Thousands of persons have testified that by their use alone they have been restored to health after other remedies had proved unsuccessful.

# GREEN'S PATENT "SILENS MESSOR" & "MONARCH"

NOISELESS LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856,

And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

## GREEN'S PATENT ROLLERS

For Lawns, Drives, Bowling Greens, Cricket Fields and Gravel Paths.

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in two parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.
